March, 1992

The Jefferson Parish Council and Parish President
1221 Elmwood Park Boulevard
Harahan, Louisiana 70123

Dear Councilmen and Mr. Yenni:

We are pleased to submit the Jefferson Parish Municipal Golf Course Feasibility Study to the Parish Administration and Council for your consideration and further action. It is the result of extensive research and detailed analysis by the firms of Design Consortium, Ltd., Golf Resource Associates and P.B. Dye, Inc. We are each national leaders in our respective fields of recreational planning, golf market analysis and golf course design/construction.

This study identifies the significant role that golf and the golf industry has in the national business of recreation. It also presents a concept whereby Jefferson Parish can become part of this highly successful national trend.

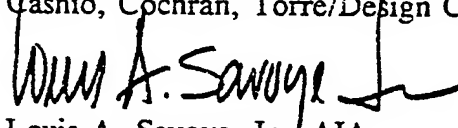

In particular, a detailed market analysis indicates that the market for this type of project exists. It identifies the various costs and other elements involved in developing such a facility. Further it shows that it could be a successful and profitable recreational asset for Jefferson Parish.

Equally important, if developed along the lines of the concept presented, the project would be a significant economic development stimuli that would be a visitor/tourist magnet. Other states and communities are aggressively pursuing quality public golf facilities as successful tourist attractions, while offering top quality golf recreation to its residents.

Jefferson Parish has the opportunity to develop a most significant recreational and economic development asset for now and future generations. The project could effectively provide a new quality recreation facility, while simultaneously producing a new source of revenue.

Thank you for allowing us to be part of such a significant project. We look forward to the opportunity of assisting you further in bringing this concept to reality.

Sincerely,
Cashio, Cochran, Torre/Design Consortium, Ltd.

Executive Summary

The Jefferson Parish Municipal Golf Course Feasibility Study assesses the feasibility of developing a championship quality, regulation play 18-hole municipal golf course in Jefferson Parish, Louisiana. The study evaluates the market potential of golf in the Jefferson Parish market area, and details in the proforma the costs of design and construction of the golf course by P.B. Dye, a known design/build golf course architect. The financial feasibility is determined by the net operating income where the municipal golf course can be operated with minimum financial exposure to the Parish of Jefferson.

Around the country, golf is big business, one that annually pumps \$20 billion dollars into the national economy according to the National Golf Foundation, a non-profit organization dedicated to the advancement of the game. New golf course projects, whether public or private, have had difficulty keeping pace with the growing number of players. In the past 10 years, golfers increased from 14.6 million to 24.7 million, or 69%, while the number of courses increased by 1,040, or 8%.

What has retarded the growth of the game of golf in Jefferson Parish is the lack of publicly accessible golf courses. Currently there are no public golf courses in Jefferson Parish to serve the nearly half million population.

The purpose of building a municipal 18-hole golf course in Jefferson Parish is two fold. 1) To serve the Jefferson Parish public golfer who currently must compete for playing time on the public courses provided in neighboring Orleans Parish. 2) To serve as an economic development tool for Jefferson Parish by a) Serving as a catalyst and accelerating development of one of the last easily developed land areas into commerce resulting in new revenues for the Parish, and b) by developing a quality golf course designed to attract the vacationing and tourist golfer. Golfers utilize "golf packages" at record levels to other communities nationwide as well as to those communities as nearby as the Mississippi Gulf Coast where "Golf is big business".

■ Project Concept

Key elements in the project concept involve:

- (a) the Parish as the facilitator or generator of the concept,
- (b) a private land donor who would provide a project site
- (c) design of the golf course by a nationally recognized design/build golf course company,
- (d) a golf course management entity and
- (e) financing via public and/or private sources.

Market Demand/Market Mix

Review and evaluation of the demographic and socioeconomic characteristics of the resident population within the market area for the proposed Jefferson Parish golf facility revealed that an estimated 6 percent of those residents who are five years of age or older can be considered as potential golf participants.

Public Golfers

It is estimated that the proposed facility's defined market area potentially contains nearly 60,000 resident golf participants and that approximately 30,000 of these golf participants would normally prefer to participate in the game at a public golf facility. It is further estimated that, by 1995, the number of public golfers in the market area will approximate 29,000. This will generate approximately 540,000 annual rounds of play.

Private Crossover Golfers

Research also indicates that public facilities will receive some play from private golf participants. It is estimated that these "crossover" golf participants will contribute approximately 34,000 annual rounds of play to the projected market demand potential. This projection should increase with the availability of top quality public golf facilities at reasonable fees.

Visitor/Tourist Golfers

Given the presence of a national visitor/tourist population in the greater New Orleans area that reportedly exceeds 6 million, it can reasonably be estimated that nearly 135,000 additional golfers could be visiting the Jefferson Parish market area on an annual basis. If 50 percent of these potential golfers were to play one round of golf during their stay in the area, approximately 70,000 additional rounds of play could be added to the overall unserved market demand potential.

In total, it is estimated that by the year 1995 the combined resident public golf facility users, crossover private golfers, and visitor/tourist golfers could generate approximately 640,000 annual rounds of play.

Unserved Market Demand

It is estimated, on the basis of the potential demand which could be created by the market area's resident and visitor golf population less the level of demand that is accommodated by the market area's existing public golf facilities, that the current and projected unserved demand potential is approximately 120,000 annual rounds of play. It would require two or three additional public golf courses to accommodate this unserved market.

Jefferson Parish Municipal Golf Course

The Jefferson Parish Municipal Golf Course proposed in this study is a championship quality, regulation play, eighteen (18) hole golf course developed on a minimum 175 acre site and accommodates the design requirements of a top quality golf facility. This site size is a prerequisite of this project concept. It is proposed that the facility be designed and built by a known name in golf design, P.B. Dye of P.B. Dye, Inc. The project would include the golf course, practice range, a combination club house/pro shop/cart storage building, maintenance facilities, parking and other normally required elements.

The total estimated initial project cost of \$5,678,047 is based on the following cost breakdown:

(a)	Golf Course Construction	\$3,090,794	
(b)	Golf Course Design Fee	\$335,000	
(c)	Legal and Administrative Fees	\$225,000	
(d)	Maintenance Building	\$332,500	
(e)	Road and Utilities	\$625,000	
(f)	Golf Cart Storage Building	\$270,000	
(g)	Temporary Pro Shop	\$50,000	
(h)	Parking Lot and Drives	\$132,000	
(i)	Design Fees for e,f,g,h	\$107,700	
(j)	Golf Course Equipment	\$239,670	
(k)	Contingency @ 5%	\$270,383	
	Estimated Initial Project Costs		\$5,678,047
(l)	Permanent Club House/Pro Shop	\$649,000	
	Total Estimated Project Costs		\$6,327,047

The above summation of total project cost assumes the donated land concept. With the donated land approach, a consideration should be given to off setting road and utility costs with lot sale rebates to Jefferson Parish, or utilize these funds for increased debt service.

Financial Feasibility

The Jefferson Parish Municipal Golf Course is projected to support 30,000 - 35,000 rounds of golf in its opening year and to reach maximum play of 50,000 rounds in ten (10) years. Initial green fees would average \$20.00 - \$25.00 dollars. Priority will be

given to local golfers, with "out of towners" green fees 10-20% higher.

A proforma of income and expenses was forecast over a ten year period and assumes a 20 year debt amortization period. The proforma clearly shows the facility will become self supporting by the third year and profitable by year five. Note that this proforma assumes that the golf course would be constructed on land donated to Jefferson Parish. If the provision of the lot rebate concept were integrated into the pro forma, cash flow would increase and debt retirement and/or profit would improve.

Marketing Program/Economic Development

With the implementation of an aggressive marketing plan, one that emphasizes individual and group outing play from conventioners and tourist, it can be anticipated that at least 25 percent of play at the proposed Jefferson Parish golf facility could be derived from the visitor/tourist segment of the golf market.

In addition to attracting golfers from the strong visitor/tourist market, the marketing program would specifically target the national vacationing golfer. The proforma allocates \$50,000 annually for the first and second years of advertising/marketing, then is reduced 5% per year as the facility's recognition and use increases. Essential to the success of the marketing program is a top rated signature golf facility that the national golfer has come to expect.

INTRODUCTION

This report is an investigative study conducted to determine the feasibility of developing a champion quality, regulation play 18-hole municipal golf course in Jefferson Parish, Louisiana. The study evaluates the market potential of golf in the Jefferson Parish market area, the availability of land suitable in size and topography to the development of a quality golf course facility, and details in the pro forma the costs of design and construction of the golf course by P. B. Dye, a known design/build golf course architect. The financial feasibility is determined by the net operating income where the municipal golf course can be operated with minimum financial exposure to the Parish of Jefferson.

■ Background-The Golf Industry

Around the country, Golf is big business, one that annually pumps \$20 billion dollars into the national economy according to the National Golf Foundation, a non-profit organization dedicated to the advancement of the game. New golf course projects, whether public or private, have had difficulty keeping pace with the growing number of players. In the past 10 years, golfers increased from 14.6 million to 24.7 million, or 69%, while the number of courses increased by 1,040, or 8%.

The National Golf Foundation predicts that one new golf course per day until the year 2000 is required just to keep pace. And nowhere is the potential for development greater than in the South, which has the fewest golf holes per capita of any region in the country and where the weather is suited to year round play.

The American Society of Golf Course Architects, realizing the paucity of good municipal courses, is encouraging village, county, park district and state officials to consider the construction of daily fee courses when economically feasible.

As a rule, a municipal course can mean an economic boost to a community. Few municipal course operators dispute the benefits of these projects, but many are surprised at the profits a municipal golf course can yield. Some public courses in the Southeast and Western regions of the United States produce annual net profits in excess of \$300,000. The profits parlay into a positive economic influence on a community, creating jobs at various levels and attracting new business and industry.

■ Comparable Golf Development

Before one dismisses the optimistic forecast of the National Golf Foundation, consider an ambitious public golf course construction project announced in our neighboring state of Alabama. Four (4) golf complexes are planned with 54 holes at two sites and 36 holes at the other two sites, designed by a name golf course designer and including a lighted par-3 course for evening play. Green fees are in the \$20-\$25 range. The courses can be walked, the ecology, the environment, and reduced pesticide and herbicide use

are some of the project's primary objectives.

The 180 holes are planned to open in less than a year. Various corporations and cities in effect have donated the land at no cost. These will be daily fee public courses financed by Retirement Systems of Alabama which is in the business of investing pension funds for the State of Alabama. The courses are developed as stand alone profit making ventures and viewed as providing an economic impact for the towns and cities where they are located.

A 1990 National Golf Foundation report shows the state of Alabama ranking 43rd in "golf accessibility," which is simply population per 18 holes of publicly accessible golf. Louisiana ranks 46th. "We're way behind in public courses," agrees Buford McCarty, executive director of the Alabama Golf Association. He says that as each new public course is opened, golfers seem to fill it to its 60,000 rounds per year capacity. None of the older facilities have experienced any falling off as new courses open. So the golfers are there !

The multi-course project isn't only for Alabama golfers, but has the golfing tourist and vacationing golfer in mind, as well as a lure for retirees. Research has shown that people visit three times on the average before moving to a place to retire. The multi course golf project will increase the visitation of this potentially lucrative group of people.

If you have a group of great golf courses, then they can be promoted to tourists as a golf mecca. All the courses are within five to 15 miles of an interstate. Alabama has always been a pass through state to Florida. Florida courses that are the destination of the travelers are costly, compared to the projected green fees in Alabama. According to the director of the Bureau of Tourism and Travel, "Alabama has a tremendous climate; its an ideal state for golf. The courses will be first class, and you can never have too many golf courses".

Jefferson Parish-Municipal Golf

While golf has been played in the United States for more than a century, much of that time the game of golf has retained an exclusivity that has retarded its growth. That is, until the advent of the municipal golf course. The arrival of a public, daily-fee golf course put the game within the reach of the general public, commencing a period of sustained growth. This statement from the National Golf Foundation "Municipal Golf Courses Make Dollars and Sense" sums up the plight of the game of golf in Jefferson Parish and the New Orleans metropolitan area.

Until the economic downturn in the Oil and Gas Industry forced a number of golf courses to operate as Daily Fee Courses, the access to the game of golf was almost

exclusively through membership in area country clubs. The public golfer played the municipal courses at City Park, Audubon Park, Bartholomew and Brechtel in Orleans Parish. Jefferson Parish has no municipal golf courses nor does any other parish in the region. This exclusivity has retarded the growth of golf in this area, and according to local golf professionals has severely limited the play to juniors and women, the two high growth areas in national golf statistics.

To stimulate the growth of golf more municipal courses are needed. The construction of a municipal course is considered practical as long as there are 25,000 to 30,000 people in a given area not served by a daily fee facility, according to the market research of the National Golf Foundation. Jefferson Parish with its population base of approximately 500,000 people has one (1) Daily Fee golf course at Bayou Barriere in Belle Chasse and a Daily Fee course at Plantation in the incorporated municipality of Gretna located in Jefferson Parish.

A municipal facility is open to everyone and generates its own participation by expanding the player base to appeal to a wider spectrum of the general population. It encourages the first time golfer, who can pay as he goes and not have to incur the expense of club membership. It is essential to the future of the game of golf in the New Orleans Metropolitan area that access to public facilities become more commonly available. Today the golf courses are competing for the same player without expanding the player base.

Properly developed and managed, municipal golf courses have proven to be profitable enterprises for the municipalities and have generated recreation dollars for future golf course expansions and other recreational needs. It has long been noted that revenues generated by Golf at City Park supports the overall maintenance of the park.

Louisiana ranks 31st among states with 221,000 golfers, but in the percentage of the population participating in the sport, the state ranks 46th. Only 5.4 percent of Louisiana's inhabitants played a round of golf in 1989. Paradoxically, the solution is to build more municipal golf courses and increase the public access to golf facilities.

The future of golf is in attracting the first time golfer, the female golfer and the junior golfer to the game. According to NGF statistics these are many times one and the same. There are an estimated 5.4 million female golfers representing 21.8 percent of the U. S. golfing population. In 1989, 40.2 percent of beginning golfers were female. Females constitute a much larger percentage of beginning golfers than of the entire golfing population. Among female golfers 78 percent are public golfers, those who play 50 percent or more of their rounds at public golf facilities. Female golfers average 15.5 rounds annually.

There are an estimated 2 million junior golfers representing 8 percent of the U. S. golfing population. Males are dominant in junior golf, accounting for 81.8 percent of the junior golfer population. An overwhelming majority of junior golfers (81.6%) play 50 percent or more of their rounds at a public golf facility. Junior golfers play an average of 13 rounds annually.

The public course at City Park in Orleans Parish has a program which enrolled 500 Junior Golfers. The majority of the junior golfers reside in Jefferson Parish.

Purpose

The purpose of building a municipal 18-hole golf course in Jefferson Parish is two fold.

1) To serve the Jefferson Parish public golfer who currently must compete for playing time on the public courses provided in neighboring Orleans Parish. The seven (7) municipal golf courses plus four (4) daily fee facilities provide a total of eleven (11) public golf courses in St. Bernard, Plaquemines and Orleans Parishes to support public golf for the entire region. Currently there are no municipal golf courses in Jefferson Parish to serve its nearly half million (500,000) population base. 2) To serve as an economic development tool for Jefferson Parish by a) serving as a catalyst and accelerating development of one of the last easily developed land areas into commerce, resulting in new revenues for the Parish, and b) by developing a quality golf course designed to attract the vacationing and tourist golfer.

Local Public Golfer

The prospective users of the Jefferson Parish Municipal Golf Course are the local public golfer, residents of Jefferson Parish and those region wide to include Orleans Parish, St. Bernard Parish, St. Charles Parish and Plaquemines Parish drawing from a population base of 1,050,000 people. Users are men, women, and junior golfers.

Vacationing Golfer

To augment the local golfer, is the vacationing and visitor / tourist golfer. The vacation golfer are those golfers who specifically utilize golf packages or travel to play golf. An example is the Mississippi Gulf Coast where from January to May, midwestern and Canadian golfers frustrated with snow covered courses at home come to play golf. Promoted as "the South's affordable golf resort", the Mississippi Gulf Coast has fourteen (14) daily fee and public golf courses and year round golf vacation packages where golfers can choose from very basic offerings of room and green fees to luxury packages with all the amenities.

As far as this study can determine the vacationing golfer is an unknown quantity in the tourist industry of Jefferson Parish and the metropolitan area. Although the region sports over thirty (30) golf courses and nearly year round playing weather, no attempt has been made to promote and market New Orleans as a golf vacation destination.

Tourist Golfer

The visitor/tourist golfers are those who come to the New Orleans Area on conventions, business meetings, and other business and play golf as a secondary activity. The tourist golfer is an essential ingredient in the business of golf in New Orleans today, as private courses allow for the "out of town" to play while restricting play to the local golfer

who can play by invitation or membership only. New Orleans area golf course managers acknowledge the contribution made by the visitor/tourist golfer to the overall viability of local private country clubs.

Study Approach and Methodology

To develop the concept of constructing by national standards a quality golf facility for use by the public golfer of Jefferson Parish but which would also appeal to the vacationing and tourist golfer, a team of professionals with expertise in the area of recreation planning, golf course design and golf market feasibility was assembled. For only one of the above listed professional disciplines to have undertaken this study would not have provided the comprehensive approach and results that this study has, thus rendering more credibility to the findings and recommendations.

The Study Team

Design Consortium, Ltd., are specialists in the design and planning of recreational facilities nationwide, and is the lead firm for this study with the responsibility of coordinating the efforts of P.B. Dye and Dye Golf, Inc., a well known golf course architect and design/build firm with direct and recent experience in the design and construction of public golf facilities, and Golf Resource Associates (GRA) a national firm specializing in Golf Market Evaluation.

Design Consortium, Ltd.

Cashio, Cochran, Torre/DESIGN CONSORTIUM, LTD., one of the largest landscape, architectural and planning firms in the Gulf South, has provided a variety of professional services for government agencies, industry, public and private institutions, and individuals since its founding in 1968. The firm has planned, designed and built projects throughout the United States and offers a complete range of planning, design and management services. Because of the diversity of their project experiences, they have the capacity to address complicated issues, coordinate the efforts of other design consultants, and manage the overall conduct of large-scale projects. Design Consortium represents 20 full-time professionals who have been personally involved with projects similar to the one being addressed in this study. In recent years, the firm has focused its activities on recreational/waterfront planning and design, urban design, zoological and environmental planning.

In Jacksonville, Florida, Design Consortium completed design and planning of the waterfront development on the St. John's River. Their conceptual plans and illustrations were successful in presenting development potential to the City Council, business interest, investors and general public. By clearly showing the proposed development as it fit into the existing site they were able to generate widespread support for the project. This translated into municipal funding, private investment and public enthusiasm for the development ingredients essential to the construction of any project. Construction on this \$6 million project was completed in 1988. The Southbank Riverwalk project is a 1989 ASLA Merit Award Winner.

For the State of Louisiana, the firm has completed the Bayou Segnette State Park, Jefferson Parish (\$9.0 million on construction cost). Included in this project are a park center complex, overnight camping facilities, cabins, and a 300-acre day-use area.

A comprehensive recreation master plan was prepared by Design Consortium for Jefferson Parish. This study proposed a creative and diverse plan for maximizing the recreation opportunities that exist in the Parish. This plan represents the imaginative and effective planning abilities required to produce such studies.

Projects like Bayou Segnette Park and Recreation Master Planning Jefferson Parish, Southbank Riverwalk in Jacksonville, Florida, and Mississippi Gulf Coast study all represent complex planning studies which interweave diverse elements into a thread of common benefit and interest in pursuit of what are the intrinsic environmental values of those communities. These project planning abilities are also provided by Design Consortium in this feasibility study.

■ P.B. Dye, Inc.

P.B. Dye, Inc., is a golf course design/build firm headed by P.B. Dye, son of legendary golf course designer Pete Dye. Since 1981, P.B. has had a hand in the design of about two dozen golf courses. Three of these golf courses are on the current list of top 100 golf courses in the United States, according to Golf Digest and Golf Magazine. In particular, P.B. Dye, Inc. has experience in the design/build of public golf courses. Northwoods Golf Club of Columbia, South Carolina, completed in 1990, is an example of a P. B. Dye public facility designed with private club amenities. According to the Northwoods owners, "the Dye name is marketing magic, let P. B. build it and the players will come".

Given the natural ecology and drained wetlands topography of most undeveloped sites in Jefferson Parish, P.B. Dye has extensive experience in designing and building golf courses on sites where conservation and protection of wetlands are top priority. A Dye design works with the natural terrain and vegetation of the site, utilizing drainage techniques indigenous to the New Orleans area.

Carving Dye's vision into the earth are no mere bulldozer operators, but college graduates who have studied agronomy, turf grass management and other applied sciences. P. B. Dye, Inc. is a design build firm with hands on experience in the actual construction of the courses they design.

Based on an on-site visit to undeveloped areas of Jefferson Parish where P. B. could see first hand the site conditions, soils and natural vegetation of vacant land available for

development, P. B. has personally designed the Routing Plan for this study. Design Consortium complimented the Dye routing plan with conceptual enhancement of the golf course features.

With P.B. Dye's current and active participation in the design, construction and operation of several quality new public golf facilities, the Dye organization was the source of much of the cost, construction and proforma data utilized in the preparation of this study.

■ Golf Research Associates GRA

Golf Research Associates is a golf facility development and operations consulting firm with nationwide experience and expertise in all aspects of the planning, development, operations and marketing of public and private golf facilities.

In the context of this feasibility study, GRA conducted the Golf Market Evaluation of the Jefferson Parish Market Area, which is an in-depth market demand analysis containing all the essential elements necessary to provide an assessment of the market potential of the proposed municipal golf facility.

The Golf Market Evaluation reviews and evaluates key demographic and facility operating characteristics within a carefully defined market area, and provides projections relating to the total market demand potential and unserved market demand as related to the need for the proposed facility.

Project Concept

Research and investigation into the feasibility of developing the Jefferson Parish Municipal Golf Course indicates that the project may require the joint effort of public and private participation to be feasible. Key elements in this concept involve (a) the Parish as the facilitator or generator of the concept, (b) a private land donor who would receive the benefits of substantial increased value of residual adjacent real estate, (c) the participation of a design/build golf course company, (d) a golf course management entity and (e) financing via public or private sources.

Land Donation

Given the history of golf course development in Jefferson Parish and nationally, golf courses have been the mainstay of residential land development. Today, golf courses generally are built to sell real estate. The appeal of the golf course makes residential land sites more attractive, more valuable and more saleable.

With the advent of the conference center and corporate meeting and convention facility, other compatible commercial uses which benefit from proximity to a golf course have emerged. The golf course designed as part of the commercial development gives the commercial land developer a competitive edge.

Even more today, developers are willing to donate the land and certain improvements for the development of a golf course for the benefit of the increase in the value of the residual land. Depending on the per square foot value of the vacant undeveloped land this can be a considerable contribution to the economic feasibility of the municipal golf course project. This study includes the premise of donated land.

Role of the Parish/Municipality

Jefferson Parish would serve as the facilitator of the design, construction, maintenance and operation of a public golf course. The developer would donate the land to the Parish or to a representative of the Parish.

The Parish would act as the facilitator between the residential/commercial land developer and the Design Build Golf Course Architect and would operate the golf facility on a contractual basis with a golf course management company based upon an agreed upon pro forma of fees and operating revenue and expenses.

Economic feasibility then is the ability of the municipal golf course to generate fees and income sufficient to meet the operating expenses and debt service, and operate at break even or at minimum cost to the Parish.

■ Quality Golf Course Design P. B. Dye, Designer

The concept for this project has been to design and build a quality golf course by a golf course designer of the known caliber and success of P.B. Dye. P.B. has determined that a minimum of 175 acres of land is required for the construction of a quality course which can compete with the courses being developed around the country.

The golfer today is more sophisticated and to market a municipal golf facility to attract the vacationing golfer and to garner a share of the tourist golfer, a quality golf course built on a minimum of 175 acres of land is a prerequisite to the overall feasibility of the project.

It is reasonable to assume, given the economic downturn of recent years that there are or may be golf courses for sale in Jefferson Parish for conversion to a municipal daily fee operation. However the available courses were built on 100 to 110 acre sites.

So tight is the available land that the design options to redesign these courses are limited. The overall economic feasibility of the project depends on the tourist magnet. A minimum of 175 acres is needed to design or redesign a course to achieve today's quality ranking.

■ Financing

Two of the most common approaches to financing municipal golf courses are through recreation revenue bonds and general obligation bonds. The municipality finances the design and construction of the golf course, and retires the bonds from the operating revenue of the golf facility. Net operating income is profit to the Parish and can be used to finance an expansion of the 18 hole golf course and/or used to finance other recreational projects.

Another avenue for financing is the Lease Contract where the municipality receives the donation of the land and leases the land on a long term lease arrangement to the Design/Build party who constructs the facility and finances the project from private lenders. The debt service on the construction loan is paid from the proceeds of the facility and is considered on the proforma as an operating expense. Net operating income is profit to Parish and the golf course developer who operates the facility as a daily fee public golf course based on a proforma of fees and expenses negotiated with

the Parish.

Other financing options may be available to the Parish. If other finance options are pursued, it must be remembered that this study is based on constructing the Dye designed course, since the Dye signature course is a key element for the success of the project concept.

Evaluation of Golf Market

The following is intended as a brief review of significant findings and recommendations relating to the golf market evaluation aspects of the proposed Jefferson Parish golf facility. Specific information and data relating to the summary is included within the text of the detailed golf market evaluation in Part II of this report.

Market Demand Potential

Review and evaluation of the demographic and socioeconomic characteristics of the resident population within the market area for the proposed Jefferson Parish golf facility revealed that an estimated 6 percent of those residents who are five years of age or older can be considered as potential golf participants. In comparison, it has been estimated that 5.4 percent of the Louisiana population (age-five and older segments) participate in golf.

It is estimated that the proposed facility's defined market area potentially contains nearly 60,000 resident golf participants and that approximately 30,000 of these golf participants would normally prefer to participate in the game at a public golf facility. Given the projected decrease in the resident population and a static golf participation rate, it is further estimated that, by 1995, the number of public golfers in the market area would fall to approximately 29,000.

It is estimated that the market area's existing resident public golf facility users could potentially generate approximately 545,000 annual rounds of play. It is further estimated that by 1995, given the anticipated decrease in the market area population and the utilization of static participation and frequency of play rates, that the market area's public golf participants could potentially generate approximately 540,000 annual rounds of play.

Golf Resource Associates research also indicates that public facilities will receive some play from private golf participants. It is estimated that these "crossover" golf participants will contribute approximately 35,000 rounds of play to the current market demand potential, and approximately 34,000 annual rounds of play to the projected market demand potential.

Given the presence of a visitor/tourist population in the greater New Orleans area that reportedly exceeds 6 million, additional rounds of public golf play generated from this segment must also be considered.

If U.S. averages for the age-five and older (92.5%) population, the rate of golf participation (10.8%), and frequent golfer (22.3%) categories are applied to develop a golfer profile amongst this national visitor/tourist population of 6 million, it could reasonably be estimated that nearly 135,000 additional golfers could be visiting the defined market area on an annual basis. If 50 percent of these potential golfers were to

play one round of golf during their stay in the area, approximately 70,000 additional rounds of play could be added to the overall unserved market demand potential.

In total, it is estimated that the combined resident public golf facility users, crossover private golfers, and visitor/tourist golfers could potentially generate approximately 640,000 annual rounds of play. It is further estimated that by 1995, given the anticipated decrease in the market area population and the utilization of static golf participation, frequency of play, and tourism/visitor rates, that the market area's public golf participants could also potentially generate approximately 640,000 annual rounds of play.

■ Unserved Market Demand

Research of existing market area golf facilities indicates that these facilities currently accommodate an estimated 524,500 annual rounds of public play.

It is estimated, on the basis of the potential demand which could be created by the market area's resident and visitor golf population less the level of demand that is accommodated by the market area's existing public golf facilities, that the current and projected unserved demand potential is approximately 120,000 annual rounds of play.

■ Market Mix

For the most part, the resident population in the Jefferson Parish market area has been exposed to inexpensive public golf facilities of fair to marginal quality for a number of years. The potential operating success of an additional public golf facility in this market, particularly from the perspective of a resident golfer will be highly dependent upon the implementation of a competitive fee structure. Residents of the parish should be offered a discounted fee if possible. Because maintenance conditions at other public golf facilities in the area are not particularly noteworthy, The Jefferson Parish facility could derive an even greater level of play by exceeding the otherwise marginal maintenance practices of these other area public golf facilities.

The visitor/tourist golfer will expect to play on a golf course of higher quality, and will usually pay a higher fee to be able to do so. By offering the resident golfer a discount, the facility will essentially be expecting the visiting golfer to bear the costs associated with designing, building, and maintaining a golf course of superior quality to most others in the market area. A premium of fifteen to twenty percent over resident fee levels would be reasonable.

With respect to the levels of play that could be anticipated from each of these two market segments, it is nearly impossible to definitively predict such a distribution of

play. Based on GRA experience in golf markets throughout the United States and local and regional experience throughout the West South Central region and the greater New Orleans area, it would be reasonable to expect that the resident population should make up the majority of play at the proposed facility.

With the implementation of an aggressive marketing plan-one that emphasizes individual and group outing play from conventioners and tourists, it could be anticipated that at least 25 percent of play at the proposed Jefferson parish golf facility could be derived from the tourist/visitor segment of the golf market, with the remaining 75 percent derived from the resident population.

■ Golf Market Conclusions

The market potential for a public golf facility in the Jefferson Parish market area based on the level of support which might be derived from the estimated existing (1990) and future (1995) resident public golf market demand potential, only slightly exceeds (53,020 current and 46,646 projected) the annual rounds of play that would normally be accommodated (45,000 to 50,000 rounds) by a market area 18-hole public golf facility. This would seem to indicate that the resident public golf population is currently well served by existing market area public golf facilities.

There are, however, various other golf participation segments which must be considered. One segment of golfer whose potential contribution to the overall market demand potential which has not been quantified is the "unaccommodated" private golf participant. Although difficult to quantify, it is likely that many of the market area's potential golf participants who have been identified within the public golf market demand potential would be the private golf participant. This type of golfer will most likely require facilities and amenities that far exceed the quality of facilities found at most of the existing New Orleans municipal golf facilities, some daily fee and some private facilities.

In addition, the tourist/visitor/convention golf participation segment is an important factor to consider. According to local sources, the tourism related industries have always thrived in the New Orleans area, and various local tourism officials responded favorably to questions concerning the use of golf as a marketing tool to encourage a visit to the New Orleans area.

Although rounds generated by visitors to the area could easily exceed 70,000 per year, it would not be advisable to build a golf facility based solely on the potential rounds that may be derived from visitor populations. A municipal golf facility in Jefferson parish should primarily serve as a recreational amenity for residents of the Parish. It would also be available to the tourist, convention and motel/hotel facilities of Jefferson parish. Properly promoted, the proposed Jefferson Parish municipal golf facility could attract

regional, state, and national tournament events as well.

Although the success of any golf facility is always highly dependent upon the qualifications, experience, and effectiveness of the facility's on-site management, given the proposed facility's type, size and anticipated quality, it is the opinion of Golf Resource Associates that the actual rounds of play accommodated by the proposed facility could equal 45,000 to 50,000-an annual level of play that should be typical of a well-managed and, in terms of user fees, affordable 18-hole municipal golf facility in the Jefferson parish market area.

The total number of rounds of play on an annual basis is also highly dependent upon the marketing strategy of the facility. Although many municipalities look upon marketing as the domain of the private sector, more municipal golf facility operators have come to the realization that they must develop not only a loyal clientele, but also attract play from sources such as group outings and convention play.

Based on an aggressive marketing strategy, it could be anticipated that the proposed Jefferson parish facility would accommodate approximately 35,000 rounds of play during the first year of operation, and could reach operational maturity (50,000 annual rounds of play) by the fifth year of operation. Based upon a more limited approach to marketing in proposed facility's operating strategy, 30,000 to 35,000 rounds could be expected in the first year of operation. By the fifth year, rounds of play could reach 45,000 or more, depending upon the overall acceptance of the facility by the resident population.

Programmed Facilities

The Jefferson Parish Municipal Golf Course proposed in this study is a championship quality, regulation play, eighteen (18) hole golf course developed on a site adequate in size to accommodate the design requirements of a top quality golf facility. It is proposed to be designed and built by a known name in golf design, P.B. Dye of P.B. Dye, Inc. The project would include the golf course, practice range, a combination club house/pro shop/cart storage building, maintenance facilities, parking and other normally required facilities.

■ Golf Course Area

The total area recommended for this project would be a minimum site of 175 acres. This would provide adequate space for layout and design of the golf course, practice range, combination club house/pro shop/cart storage building, maintenance facility, parking and restroom/shelters on the course. Of the total 175 acres, 150 would be utilized for the golf course, 20 acres for the driving range, 4 acres for parking and drives and one acre for club house/pro shop/cart storage building and surrounding grounds.

■ Combination Clubhouse/Pro Shop/Cart Storage Building

Although an initial temporary pro shop without clubhouse is indicated as a method of starting the project with reduced capital investment; the concept of a combination Clubhouse/Pro Shop/Cart Storage Building should be considered. This approach requires more initial capital investment but can provide certain long term construction cost savings. The proposed building would be a modest to average size facility of approximately 12,000 square feet. The following allocations of space are proposed. A detailed program of space requirements would have to be prepared if the project moved to the design phase.

Pro Shop	1,000.00 s.f.
Club House	5,000.00 s.f.
Cart Storage	<u>6,000.00 s.f.</u>
Total	12,000.00 s.f.

■ Maintenance Facility

A maintenance building of approximately 6,000 to 8,000 s.f. to house golf course maintenance and supplies would be required for the project.

■ Parking

Golf course usage at peak times would require approximately 120 parking spaces. In addition to parking, appropriate drop off areas, service drives, walkways and cart paths would be provided.

■ Miscellaneous

Two restroom/shelter buildings of approximately 100 s.f. each would be positioned at the most functionally beneficial locations on the golf course.

Site and Conceptual Design

■ Site

The site evaluation is for a prototypical site in Jefferson Parish which would be of the size necessary to construct a 175 acre golf course. Areas of Jefferson Parish where sufficient acreage exist in this mass are located primarily on the Westbank and have the following topography.

The general topography found in this region supports a site which has 2' to 5' contour lines where the total site contours do not change more than 5'. The low elevations are typical for land in Jefferson Parish and would indicate that the use of drainage ponds would be required in the design of the Golf Course.

The site would be classified as drained wetlands and would be found within the levied areas of Jefferson Parish and thereby protected from flooding. Mitigation to the site will be required to obtain the necessary permits.

The site should be adjacent to roads and highways which offer good transportation access from most points in the region. High visibility is not necessary. Three (3) Phase Power, municipal sewer and water should be available on or near the site.

Poor structural soils do exist, and therefore certain quantities of dredging and fill would probably be required. Soil is very good fertile top soil for growing. Its suitability for grassing has to be determined.

■ General Development and Construction Cost(s)

From the beginning of this project, the concept has been to develop a municipal course which would be economically feasible to operate and which could be developed at a limited or no cost to the Parish. Land costs of between \$2,000,000-\$5,000,00 would be required to purchase 175 acres of unzoned vacant land at current land prices of between \$.25 per square foot to \$.75 per square foot.

These land cost(s) have not been included in the general development and construction costs estimated by P. B. Dye, Inc. It has been assumed that the golf course would be constructed on land donated to Jefferson Parish or to a representative of Jefferson Parish. Given this concept, we estimate the 1991 cost of building the Jefferson Parish Municipal Golf Course at \$5,678,047 not including a permanent Pro Shop or Clubhouse facility. Inclusion of the permanent Pro Shop/Club House Building would add \$649,000 to the above cost for a total cost of \$6,327,047.

■ Conceptual Golf Course Routing Plan

After an on site visit by P.B. Dye and consultation with Design Consortium a preliminary routing plan was developed and is presented herein which includes the physical layout of the 18 golf holes and approximate locations of the main features, including tees, fairways, greens, waste area, rough, hazards, and practice area. Also indicated are the recommended approximate site locations of the pro shop, club house, maintenance facilities, cart storage building, and parking areas.

From the routing plan, a conceptual delineated plan has been developed which presents the proposed Municipal Golf Course within the framework of a larger site for residential and other development.

The golf course layout planning concept provides for maximum exposure of golf course frontage for residential lots. This planning approach increases the value of the residential property making it more saleable.

Proforma and Costs

Income

The number of rounds of golf played per year, green fee cost per round, golf cart rental fees, practice range fees, food and beverage sales and pro shop sales are the major elements that determine the amount of income and cash flow for a quality golf facility.

The Jefferson Parish Municipal Golf Course is projected to support 30,000 - 35,000 rounds of golf in its opening year and to reach maximum play of 50,000 rounds in ten (10) years. Initial green fees would average \$20.00 - \$25.00 dollars, in which a range of fees would be applied to special category players, i.e. local residents, tourists, seniors, juniors, off season and weekday players. Priority will be given to local golfers, with "out of town" green fees 10-20% higher.

These projections would yield \$600,000 - \$875,000 of green fee income in the first year, or an average of \$700,000. With an average 10-12% green fee increase per year over the next five years, green fee income would increase to approximately \$1,500,000 annually over the next 5-7 years. Practice range usage would generate \$42,000 the first year and increase in proportion to usage.

Cart rental rates are proposed to be ten dollars (\$10.00) per person per round and would generate \$280,000 income the first year and increase annually in proportion to attendance/play. Food/beverage and pro shop sales the first year would provide a net income of \$105,000 and \$70,000 respectively with similar annual increases to green fees.

Expenses

Debt service for construction and equipment costs, and golf course maintenance are the major expenses in the evaluation of the feasibility of a project of this type. Operating expenses compose the other major costs. These expenses include pro shop operation and salaries, insurance, advertising/marketing, utilities, sales and property taxes, supplies, contract services and other miscellaneous expenses.

Golf course maintenance cost can vary substantially depending on the level of quality playing conditions that the facility wishes to maintain and other factors such as weather. This cost can be as low as \$200,000 annually and as high as \$400,000. For the purposes of this study \$300,000 has been budgeted for the first year in operation with an annual increase of 10% per year.

Pro shop operation and salaries are projected to be \$150,000 for each of the first three years, \$200,000 for the next five years, with approximately 10% per year increase the

next two years. Based on other comparable facilities, insurance will be \$23,750 the first year and increase approximately 5% per year thereafter.

Advertising/marketing is recommended to be budgeted at \$50,000 annually for the first and second year, then be reduced 5% per year as the facility's recognition and use increases. Telephone/utilities will be \$17,200 the first year and is projected to increase 5% per year.

Property taxes are estimated to be \$11,400 the first year with a 5% per year increase. Sales taxes at 7% are projected to be \$40,000 and would increase in proportion to sales. Supplies, contract services and other incidentals form the balance of expenses and represent approximately \$17,000 per year with an annual increase of 5%.

■ Proforma

The proforma chart indicated herein shows a ten year projection of income and expenses, and assumes a twenty year amortization. A proforma analysis detailing operating income and expenses and the net operating income is presented in the following chart. With a \$550,000 per year debt service protection, the facility would become self supporting by year three and profitable by the fifth year of operation. It is assumed that the \$550,000 per year will retire a total project cost of \$6,327,047 within 20-25 years.

The annual debt service figure of \$550,00 indicated in the proforma could vary depending on whether conventional financing or revenue bonds are used. It is assumed that an interest rate in the range of 7-9 percent could be secured for financing of the project.

To facilitate reduced capital cost at project inception, a temporary pro shop and separate cart building without club house facilities is indicated in this cost summation. If this approach is used, at a future date when the project's degree of success justifies, it is recommended that an appropriate club house/pro shop facility should be constructed.

Design/Construction Costs

Design and construction costs can vary greatly for golf course development. Some prime factors affecting the costs of these elements are quality of course design, concept, features/details of design, size (acreage) of the facility, location and geographic features of the site. To estimate costs for this study, Dye Golf, Inc. was consulted since they are actively involved in the design and construction of several courses of comparable quality to the one proposed in this study. Following is a summary of project design, construction and equipment costs. It should be noted that all cost are estimates. Actual design with material and labor take offs, plus overhead and profit are required to determine actual construction costs. It should be noted that all costs are estimates. Actual design with material and labor take offs, plus overhead and profit are required to determine actual construction costs.

Golf Course Design, Construction and Equipment Costs**A. Dye Golf, Inc. and Design and Construction Costs**

1. Golf Course Construction	\$3,090,794
2. Design Fee	\$335,000
3. Legal and Administration Fees	\$225,000
4. Maintenance Building	\$332,500
Sub total: Dye Golf, Inc. Costs	\$3,983,294

B. Other Facilities Costs

1. Road & Utilities to Club House 2500 s.f. @ \$250/l.f.	\$ 625,000
2. Golf Cart Storage Building 6000 s.f. @ \$45/s.f.	\$ 270,000
3. Temporary Pro Shop	\$ 50,000
4. Parking Lot and Drives 120 spaces @ \$1100/space	\$ 132,000
5. Design Fees for B.1, B.2, B.3, B.4 @ 10%	\$ 107,700
Sub total: Other Facilities Construction	\$1,184,700

Marketing Program

■ Concept

The proforma data developed by Dye from their experience in designing, constructing, and operating golf courses has been augmented to include in the operating expenses of \$50,000 dollars a year for the first two years for marketing the Jefferson Parish Municipal Golf Course facility to the tourist/vacationing golfer. Marketing cost decreases in subsequent years on the basis that awareness of the course's reputation is widespread.

From interviews conducted with the Greater New Orleans Hotel-Motel Association, the Jefferson Parish Economic Development Council (JEDCO), the Greater New Orleans Tourist Commission, Jefferson Parish, and the Convention and Meeting Planners of the greater New Orleans area, the vacationing golfer is an unknown quantity in the New Orleans tourist market.

In the context of tourist promotion the game of golf is perceived as a resort activity along with sun and sand. New Orleans is not viewed as a resort community and has never been promoted as such. The summer months June, July, and August are the "slow season" for tourism but are considered playable months for the game of golf. Marketing the Jefferson Parish Municipal Golf Facility would target the summer months and those off season months when tourism is fair January, May and September, to attract the vacationing golfer to the greater New Orleans area.

The budgeted marketing program is essential if this municipal facility is to be used as an economic development tool to attract the vacationing and tourist golfer to Jefferson Parish. The marketing program would concentrate on working with established efforts such as the New Orleans Marketing Committee which has been established to target the summer traveler. Promoting golf vacation packages in New Orleans could be one of the strategies adopted by the New Orleans Marketing Committee.

■ Tourist Golfer

Currently access by the tourist and the business traveler to the Greater New Orleans area golf facilities is handled through the front desks and concierge service of major hotels. The tourist/business traveler inquires from the hotel concierge who maintains a file on golf courses, their location, and fees. The concierge will call and reserve a tee time for the guest. With the exception of the New Orleans Country Club and the Metairie Country Club, the golf courses in the New Orleans Metropolitan Area are accessible and utilized by out of town visitors. As is often the case, the tourist can play during the week and at times not normally considered peak times so that availability is generally good. Green fees plus cart costs vary from a low of \$10.00 to a high of \$75.00. The tourist/business traveler come with their clubs expecting to be able to play, because as one concierge put it, "Is there no place in this country where one cannot play golf? Golf

club rental is also available.

According to the golf professionals at private, daily fee and municipal courses throughout the region, the tourist/business traveler golfer is a major player in the financial health of these golf facilities. The tourist golfer augments the play by local golfers. Private clubs maintain an "out of towners" category and fee structure to accommodate this golfer. Each golf facility deals directly with the hotels and business meeting and convention planners. There is no promotional literature presenting the golf courses of the region in a comprehensible form. Although critical to the operations of these golf facilities, there is very little promotion of Golf in the metropolitan area.

In a more structured manner, golf is utilized by the meeting and convention planners of the Greater New Orleans area who offer and are asked to provide the one (1) day golf tournament as an adjunct to the corporate, business and convention meeting. The golf facilities currently available in the New Orleans area have been adequate to meet their demand.

■ Vacationing Golfer

According to the National Golf Foundation, 6.6 million golfers take one (1) or more golf vacations every year. This represents 30.4% of the nation's 21.7 million golfers. Those that take golf vacations average 2.2 trips annually. The average length of each golf vacation is 12 days, with golf being played on an average of six (6) days out of twelve (12).

■ Profile of the Golf Vacationer

Forty (40%) percent of golf vacationers are frequent golfers playing 25 or more rounds of golf annually. This contrasts with only 25% of the golf population in general being in the frequent golfer category.

Forty-Nine percent of golf vacationers have college degrees, 80% are married, and the average household income is \$40,000. The leading destinations of Golf Vacations are Florida with 17.3%, South Carolina 8.0%, Arizona 7.6 %, California 6.0% and North Carolina 5.9%.

The purpose of the marketing program of the Jefferson Parish Municipal Golf facility would be to tap into this market for the vacationing golfer. Essential to the promotion would be a top rated golf facility of a quality the national golfer has come to expect.

Introduction

Golf Resource Associates, Inc. was retained by Design Consortium, Ltd. of New Orleans, Louisiana to prepare a Golf Market Evaluation report which was to address the market potential for an eighteen-hole municipal golf facility as proposed for development by Jefferson Parish, Louisiana.

Golf Resource Associates (GRA) is a golf facility development and operations consulting firm with nationwide experience and expertise in all aspects of the planning, development, operation, and marketing of public and private golf facilities. GRA headquarters are located near Atlanta, Georgia and additional GRA offices are maintained near Boston, Massachusetts; Tampa, Florida; and, Salem, Oregon.

Since 1986, Golf Resource Associates has been a leader in providing a wide range of development and operational advice and services to those within the golf industry, including prospective developers, existing operators, and financial institutions. The GRA professional staff has provided golf facility development and operations advice and direction to hundreds of public and private golf facility developers and operators throughout the United States and, in total, has a combination of more than seventy-five years of golf facility development and operations consulting experience.

The Golf Market Evaluation report was to specifically provide a comprehensive review of the proposed facility's anticipated golf market demand potential in terms of the potential number of existing and projected public golf facility users and the potential rounds of play which might be generated by these users. As a result of this evaluation, the report was to address existing and projected unserved market demand potential within a defined facility market area as established by GRA. It was not within the scope of this report to address the operating potential or overall economic viability of the proposed facility.

Mr. Anthony Crocco, a GRA associate consultant, conducted the on-site research for the study project and collected golf facility operating information from public and private golf facilities within the proposed facility's defined market area. When possible, Mr. Crocco also conducted interviews with key facility operating and administrative personnel. In addition to obtaining information concerning prevailing fee structures, data pertaining to typical market area golf facility operating characteristics, such as number of annual operating days and the annual rounds of play normally accommodated, was also collected.

Market area population estimates and projections, as well as pertinent demographic information used within the report, were obtained from Equifax Marketing Decision Systems, Inc., a nationally recognized purveyor of demographic and marketing information based in Encinitas, California. All pertinent information obtained from Equifax

Marketing Decision Systems has been interpreted by Golf Resource Associates in terms which allow for reasonable comparison to various accepted participant and operational standards for public golf facilities.

As a part of its continuing research into the development, operation and marketing of golf facilities, GRA maintains an extensive database of golf participation and golf course operations information. The facility operating data contained in the GRA database has been derived from on-site research of public golf facilities in every major region of the United States and, in total, reflects the operating characteristics of more than 600 of the nation's golf facilities. Much of the material in this report, including estimates pertaining to resident golf participation potential, has been drawn from this database.

The GRA database, in addition to internally generated research data, contains information compiled by national organizations, such as the Professional Golfers Association of America, the National Golf Foundation, the National Sporting Goods Association, the Golf Course Superintendents Association of America, the United States Golf Association, and recognized private research organizations and firms, including Market Facts, Inc., the A.C. Nielsen Company, and the Urban Land Institute.

It should be understood by those who will use this report as a guideline, however; that each golf market, as well as each development situation, is unique unto itself and that averages, medians, percentages and estimates which will enable a precise prediction of market area demand are rarely available.

It must be further understood that conclusions or recommendations contained within the report herein, while they may sometimes conflict with generally established standards, are made on the basis of those standards which Golf Resource Associates found to be generally applicable to the special demands and situations associated with the development of the proposed golf facility and golf participation and play potential within the defined Jefferson Parish market area.

Terms and Abbreviations

The following definitions and explanations concern common terms and abbreviations which are used within the text of this report. Given regional and local variations in the usage of certain golf and market research terms, it is of benefit to become acquainted with the use of such terms and abbreviations as they are used within this report.

Common Terms

Private Golf Club: A private golf club is defined as a golf facility which restricts use to members of the club and their guests. The members may or may not have an individual proprietary interest, or the club may be owned by private enterprise which makes it available to members for dues or fees.

Daily Fee Golf Facility: A daily fee golf facility is defined as a golf facility which is privately-owned but open to public play. Memberships or annual passes may or may not be available. Golf facilities which offer limited public accessibility through payment of green fees (semi-private golf facilities) are included in this category.

Municipal Golf Facility: A municipal golf facility is defined as a golf facility which is owned by a tax-supported agency such as a city, county, state, school, park district, or other special tax districts. The facility may be operated by the agency or by private enterprise under the terms of lease agreement or other arrangement. This type of facility is open to the general public and may or may not offer memberships or annual passes.

Golf Facility: A golf facility is a private or publicly accessible facility which offers the opportunity to participate in the game of golf on one or more regulation length, executive length or par-3 golf courses. A golf facility contains at least one nine-hole course and may include different types of courses such as a regulation length course and a par-3 course.

Golf Course: A golf course is a set of at least nine separate holes and not more than 27 holes and may be of regulation length, executive length or par-3 length.

Regulation Length Golf Course: A traditional length or full-sized golf course with a total length of over 5,200 yards for 18 holes and a par rating of 66 or more.

Executive or Mid-Length Golf Course: A shorter or compact version of the regulation length golf course with a total length of 4,000 yards to 5,200 yards for 18 holes with a par rating of 58 to 66.

Par-3 Golf Course: A short course comprised solely of par-3 holes with a total length that is under 4,000 yards for 18 holes and a par of 54 strokes.

Golf Participants: Persons who engage in one or more rounds of play on a regulation length, executive length, or par-3 golf course. A "public" golf participant is a golfer who plays the majority of his or her rounds of play at a municipal or daily fee golf facility. A "private" golf participant is one who most often participates in the game at a private membership golf club.

Potential Golf Participants: Persons residing within a specific market area who, on the basis on the socioeconomic profile of the market area population, would normally have an inclination to participate in golf. Those included within the potential golf participant segment may, or may not, actually participate in golf.

Round, or Round of Play: A unit used to measure golf course frequency of play. A round designates one golf participant, on one particular day, and includes play of 9 or 18 holes.

Executive Summary

The following is intended as a brief review of significant findings and recommendations relating to the development of the proposed Jefferson Parish golf facility. Specific information and data relating to the summary is included within the text of this report.

Market Demand Potential

- Review and evaluation of the demographic and socioeconomic characteristics of the resident population within the market area for the proposed Jefferson Parish golf facility revealed that an estimated 6 percent of those residents who are five years of age or older can be considered as potential golf participants. In comparison, it has been estimated that 5.4 percent of the Louisiana population (age-five and older segments) participate in golf.
- It is estimated that the proposed facility's defined market area potentially contains nearly 60,000 resident golf participants and that approximately 30,000 of these golf participants would normally prefer to participate in the game at a public golf facility. Given the projected decrease in the resident population and a static golf participation rate, it is further estimated that, by 1995, the number of public golfers in the market area would fall to approximately 29,000.
- It is estimated that the market area's existing resident public golf facility users could potentially generate approximately 545,000 annual rounds of play. It is further estimated that by 1995, given the anticipated decrease in the market area population and the utilization of static participation and frequency of play rates, that the market area's public golf participants could potentially generate approximately 540,000 annual rounds of play.
- GRA research also indicates that public golf facilities will receive some play from private golf participants. It is estimated that these "crossover" golf participants will contribute approximately 35,000 rounds of play to the current market demand potential, and approximately 34,000 annual rounds of play to the projected market demand potential.
- Given the presence of a visitor/tourist population in the greater New Orleans area that reportedly exceeds 6 million, additional rounds of public golf play generated from this segment must also be considered.
- If U.S. averages for the age-five and older (92.5%) population, the rate of golf participation (10.8%), and frequent golfer (22.3%) categories are applied to develop a golfer profile amongst this national visitor/tourist population of 6 million, it

could reasonably be estimated that nearly 135,000 additional golfers could be visiting the defined market area on an annual basis. If 50 percent of these potential golfers were to play one round of golf during their stay in the area, approximately 70,000 additional rounds of play could be added to the overall unserved market demand potential.

- In total, it is estimated that the combined resident public golf facility users, cross-over private golfers, and visitor/tourist golfers could potentially generate approximately 640,000 annual rounds of play. It is further estimated that by 1995, given the anticipated decrease in the market area population and the utilization of static golf participation, frequency of play, and tourism/visitor rates, that the market area's public golf participants could also potentially generate approximately 640,000 annual rounds of play.

■ Unserved Market Demand

- Research of existing market area golf facilities indicates that these facilities currently accommodate an estimated 524,500 annual rounds of public play.
- It is estimated, on the basis of the potential demand which could be created by the market area's resident and visitor golf population less the level of demand that is accommodated by the market area's existing public golf facilities, that the current and projected unserved demand potential is approximately 120,000 annual rounds of play.

■ Conclusions

The market potential for a public golf facility in the Jefferson Parish market area, based on the level of support which might be derived from the estimated existing (1990) and future (1995) resident public golf market demand potential, only slightly exceeds (53,020 current and 46,646 projected) the annual rounds of play that would normally be accommodated (45,000 to 50,000 rounds) by a market area 18-hole public golf facility. This would seem to indicate that the resident public golf population is currently well served by existing market area public golf facilities.

There are, however, various other golf participation segments which must be considered. One segment of golfer whose potential contribution to the overall market demand potential which has not been quantified is the "unaccommodated" private golf participant. Although difficult to quantify, it is likely that many of the market area's potential golf participants who have been identified within this report as "private" golfers could be included within the public golf market demand potential. This type

of golfer will most likely require facilities and amenities that far exceed the quality of facilities found at most of the existing New Orleans municipal golf facilities.

In addition, the tourist/visitor/convention golf participation segment is an important factor to consider. According to local sources, the tourism related industries have always thrived in the New Orleans area, and various local tourism officials responded favorably to questions concerning the use of golf as a marketing tool to encourage a visit to the New Orleans area.

Although rounds generated by visitors to the area could easily exceed 70,000 per year, it would not be advisable to build a golf facility based solely on the potential rounds that may be derived from visitor populations. A municipal golf facility in Jefferson Parish should primarily serve as a recreational amenity for residents of the Parish. It would also be available to the tourist, convention, and business traveler market as an added incentive to utilize the convention and motel/hotel facilities of Jefferson Parish. Properly promoted, the proposed Jefferson Parish municipal golf facility could attract regional, state, and national tournament events as well.

Although the success of any golf facility is always highly dependent upon the qualifications, experience, and effectiveness of the facility's on-site management, given the proposed facility's type, size, and anticipated quality, it is the opinion of Golf Resource Associates that the actual rounds of play accommodated by the proposed facility could equal 45,000 to 50,000—an annual level of play that should be typical of a well-managed and, in terms of user fees, affordable 18-hole municipal golf facility in the Jefferson Parish market area.

In summary, it is the opinion of Golf Resource Associates that the overall level of demand for public golf in the Jefferson Parish market area, is sufficient to warrant further exploration of the feasibility of developing the proposed Jefferson Parish municipal golf facility.

Evaluation of Market Demand

The primary objectives of the market demand evaluation is to ascertain and document the potential level of demand for golf within the proposed facility's specific market area and, to interpret these findings in terms of the potential amount of surplus, or unserved demand that is likely to be available for absorption by the proposed facility.

The following discussion provides information concerning the Jefferson Parish, Louisiana area; a definition of the geographical boundaries of the market area that is likely to be served by the proposed golf facility; examines and evaluates those socioeconomic and demographic characteristics which relate to the probable level of resident golf participation; and, based upon estimated levels of the potential demand for golf within the market area, provides estimates concerning the potential extent of existing and projected unserved market demand.

Market Demand Potential

While the avid golf participant may occasionally travel an unusually long distance to participate in a round of golf, ongoing golf participation research indicates that the typical public golf facility will derive the majority of its annual play from a definable market area.

Research concerning the travel habits of the typical golf participant, for instance, reveal that the typical golf participant resides within approximately 10 miles and/or a 17-minute drive of the golf facility at which he most often participates. Practical experience also indicates that a golfer's travel habits will vary in accordance with ease of travel within the local area and the overall extent of golf facility accessibility.

A Market Facts, Inc. survey, *Golf Participation in the United States*, indicates that approximately 58 percent of the nation's golf participants live within ten miles of the golf course at which they most often play, and that 87 percent of the typical golf facility's most frequent users reside within a 20-mile drive of their most frequently visited golf course destination.

Survey participants, when questioned as to the maximum distance they would be willing to travel to participate in a single round of golf, responded that 30 miles, or approximately 40 minutes of driving time, was a typical limit. Figure 1.0 (following page) provides further detail concerning the travel habits of the average golf participant and indicates the range of the market area for the typical golf facility.

The market area for the proposed Jefferson Parish golf facility, in terms of its resident golf population, is primarily based upon the anticipated travel habits of the typical golf participant and the ease of access to the proposed site via the primary and sec-

ondary roadway system within the area.

The market area for the proposed facility, denoted within this report as the "Jefferson Parish Market Area," is the geographic trade area from which the facility is most likely to attract frequent users and those users who will visit the facility on a more occasional, but somewhat regular, basis.

The geographical boundaries of the defined market area are depicted in Figure 1.1 (following page).

As the map in Figure 1.1 indicates, the Jefferson Parish market area, as defined herein, encompasses all of Jefferson Parish, and portions of Orleans Parish, Plaquemines Parish, St. Bernard Parish, and St. Charles Parish, Louisiana. This area primarily encompasses the greater New Orleans, Louisiana area.

Major vehicular arteries within the defined market area include Interstate Routes 10 and 610; U.S. Highways 90 and 61; and, Louisiana State Routes 47, 3018, 3017, 3139, 3134, and 23. The major population centers included within the geographic boundaries of the Jefferson Parish market area, in general, are within approximately 30 to 35 minutes from the location of the likely development site for the proposed Jefferson Parish golf facility.

The following discussion is based upon ongoing golf participation research and provides a review of key demographic characteristics (age of population, household income, educational attainment, and type of employment) as they relate to the anticipated level of participation in golf.

GOLF PARTICIPANT TRAVEL HABITS

Distance Traveled to Most Frequently Played Golf Course

Travel Time to Most Frequently Played Golf Course

Demographic Characteristics of Golf Participants

Research concerning the characteristics of those who participate in golf continues to indicate that there is a direct correlation between the age level, the level of household income, educational attainment, and the occupational characteristics of a specific pop-

ulation and their tendency to participate in golf. In general, researchers have found that the nations public and private golf participants are more mature, have achieved a higher degree of affluence, and are better educated than the nation's population as a whole.

• Age Characteristics of U.S. Golfers

Golf participation surveys continue to indicate that there is a clear correlation between age and the general tendency to participate in golf.

The graph in Figure 1.2, which is based on a Market Facts January, 1989 golf participation survey, as reported in the NGF's *Golf Participation in the United States—1990*, graphically illustrates the typical relationship between age group structure of a population and the tendency for individuals within these age groups to participate in the game of golf.

As Figure 1.2 indicates, the rate of golf participation among the nation's 20 to 29 year old population is, at slightly more than 16 percent, significantly higher than the rate of participation of those in other age group segments. The graph, however, also illustrates that at least one in every ten of those who fall between 30 and 59 years of age is likely to participate in the game.

• Household Income Characteristics of U.S. Golfers

Figure 1.3 depicts the level of golf participation by household income level as determined by Market Facts in its survey of the nation's golf participants.

As the graphic clearly illustrates, there is a direct correlation between household income, and the incidence of participation in golf. In general, those who reside in households with less than \$30,000 of annual income are less likely to participate in golf than the nation's population as a whole.

**■ GOLF PARTICIPATION RATE
by Age of Participant**

FIGURE 1.2

Source: Golf Resource Associates;
NGF Market Facts, Inc.

**■ GOLF PARTICIPATION RATE
by Household Income**

FIGURE 1.3

Source: Golf Resource Associates;
NGF Market Facts, Inc.

At the same time, as Figure 1.3 clearly indicates, those who are in households with a total of \$75,000 or more income tend to participate in golf at a rate which is nearly two times greater than the average for the nation's population.

• Educational Characteristics of U.S. Golfers

Past National Golf Foundation surveys have found that America's typical golf participant has achieved a higher level of education than the nation's population as a whole. The median education level of all golf participants is 2.7 years of college, and the nation's public golfers have attained a median of two years of college.

Figure 1.4 depicts the relationship existing between the level of education attained and the normal tendency to participate in golf. As the graph illustrates, participation in golf tends to increase significantly as the level of education attained by the household head increases.

While less than three percent of those households who are headed by a non-high school graduate participate in golf, the incidence of golf participation among those who reside in households headed by a college graduate is more than 16 percent.

• Occupational Characteristics of U.S. Golfers

Research has shown that participation in golf can, for the most part, be directly linked to the type of employment in which one is engaged. As Figure 1.5 indicates, persons employed in those occupations which require higher levels of education and produce greater levels of income, generally have a much greater tendency to participate in golf.

Those employed in professional or managerial positions, for instance, are nearly twice as likely to participate in golf than those who are employed in blue collar jobs.

FIGURE 1.4 Source: Golf Resource Associates; NGF Market Facts, Inc.

FIGURE 1.5 Source: Golf Resource Associates; NGF Market Facts, Inc.

□ Jefferson Parish Market Area Population Characteristics

While it is virtually impossible to define the exact size or potential of any given market area, it is possible, through review and evaluation of the demographic characteristics of the resident population as compared to statewide and national norms, to derive meaningful assumptions regarding market area golf participation potential. The following evaluation of market area demographic and socioeconomic data is specifically related to those population characteristics which were identified in the foregoing discussion.

Estimates within this report which pertain to the potential level of golf participation among the market area's resident population are based upon the review and evaluation of this data in comparison to similar information for the residents of Louisiana, and the United States as a whole.

• Jefferson Parish Market Area Age Characteristics

As discussed, age is a key indicator of the likely tendency to participate in golf. Figure 1.6 depicts the resident population in the Jefferson Parish market area by age group and provides a comparison of this data with the populations of Louisiana and the U.S..

For further detail concerning Jefferson Parish market

■ PERCENT OF POPULATION...by Age Group

Age Group	Jefferson Parish Market Area	State of Louisiana	United States
5 to 14 Years	15.2%	16.2%	14.3%
15 to 19 Years	7.1%	7.6%	6.9%
20 to 29 Years	18.6%	17.0%	16.1%
30 to 44 Years	23.9%	23.2%	24.1%
45 to 54 Years	9.3%	9.4%	10.2%
55 to 59 Years	4.0%	3.8%	4.3%
60 to 64 Years	4.0%	3.6%	4.3%
65 Years Plus	10.0%	10.5%	12.6%
Median Age	31.0	30.6	33.7
Average Age	33.4	33.1	35.6

FIGURE 1.6

Source: Golf Resource Associates; Equifax Decision Systems, Inc.

area demographic and socioeconomic characteristics, as well as those of the Louisiana and U.S. populations, see the "Appendix" section of this report. The information and data included in Figure 1.6 is presented in a manner which conforms as closely as possible with the age group definitions that are used by the Market Facts organization in their determination of the incidence of participation in golf by age group.

As Figure 1.6 indicates, nearly 56 percent of the estimated 1990 Jefferson Parish market area resident population fell into those categories, ages 20 through 59, that Market Facts, Inc. identified as having the greatest propensity, by age group, to participate in golf. In comparison, 53.4 percent of the Louisiana population, and 54.7 percent of the U.S. population is included within these age group segments.

The percentage of Jefferson Parish market area residents in the age groups which have demonstrated higher than average incidence of participation rates, those within the 30 to 59 year old age categories (37.2%), is also higher than the norm for Louisiana (36.4%) but lower than the U.S. population (38.6%) in this age group segment.

On the basis of the foregoing review of the overall age structure of the Jefferson Parish market area resident population and, specifically, the direct comparison of age group data in the most active golf participant age group segments, it is reasonable to assume that residents of the defined Jefferson Parish market area would participate in golf at a rate which would be higher than that of the typical Louisiana resident.

• Jefferson Parish Market Area Household Income Characteristics

As previously indicated, a key factor in determining a population's general tendency to participate in golf is the level of household income that has been obtained by market area residents. Figure 1.7 (following page) provides a comparison of Jefferson Parish market area household income levels, as a percent of the market area's total households, with similar data for households in the United States and Louisiana.

The graph and table illustrate that household income averages in the Jefferson Parish market area are slightly higher than the Louisiana averages for households with between \$15,000 and \$49,999 in annual income, and significantly higher in those households with \$50,000 or more income—the income categories which typically produce, by percent of total, the most significant number of golf participants. The percentage of market area household incomes with \$75,000 or more income (4.5 percent) is slightly higher than the Louisiana average of 4 percent, yet is significantly lower than the U.S. (8.7 percent) average.

According to the demographic data prepared by Equifax Marketing Decision Systems, the 1990 estimated average household income for all U.S. households was \$36,474. In

comparison, the average 1990 household income in the defined Jefferson Parish market area was \$28,844 which was over \$1,500 higher than the Louisiana average income of \$27,390, yet is over \$7,000 lower than the U.S. average.

Given the foregoing review and comparison of market area household income data, it would be reasonable to assume that Jefferson Parish market area residents, based solely on household income level, should have a tendency to participate in golf at a rate which is considerably higher than the Louisiana population as a whole.

• Jefferson Parish Market Area Educational Characteristics

Figure 1.8 (following page) is based upon information obtained from the Equifax Marketing Decision Systems demographic profile report and illustrates the level of education that has been reached by residents within the Jefferson Parish market area as compared to similar educational attainment data for U.S. and Louisiana residents.

The data in Figure 1.8 indicates that post-high school education among market area residents—those segments in which participation in golf is typically the greatest—is significantly higher than the Louisiana average, and nearly equal to the U.S. average.

■ PERCENT OF HOUSEHOLDS...by Household Income

Income Group	Jefferson Parish Market Area	State of Louisiana	United States
Under \$7,500	17.4%	20.2%	11.0%
\$7,500 to \$14,999	17.1%	17.8%	14.1%
\$15,000 to \$24,999	19.7%	19.5%	17.5%
\$25,000 to \$34,999	16.5%	15.7%	15.5%
\$35,000 to \$49,999	15.8%	14.8%	18.2%
\$50,000 to \$74,999	9.1%	8.2%	14.9%
\$75,000 Plus	4.5%	4.0%	8.7%
Average HH Income	\$28,844	\$27,390	\$36,474

FIGURE 1.7

Source: Golf Resource Associates; Equifax Decision Systems, Inc.

The chart illustrates that the percentage of market area residents who have attended college (31%) significantly exceeds the norm for Louisiana (26.7%) as a whole.

The highest incidence of participation category, the college graduate, represents 16.2 percent of the market area's population while nearly 14 percent of Louisiana residents, 25 years of age and older, are reported to have college degrees. In comparison to the market area, an equal percentage of the nation's population (16.2 percent) are college graduates.

Through the foregoing comparison of educational attainment by market area, Louisiana, and U.S. residents, it is reasonable to assume, on the basis of the level of education attained, that the resident population within the Jefferson Parish market area should demonstrate a tendency to participate in golf at a rate that is significantly higher than that of the Louisiana population as a whole.

• Jefferson Parish Market Area Occupational Characteristics

As previously discussed, the occupational characteristics of a population are highly indicative of the level of golf participation. Figure 1.9 (following page) is based upon occupational employment data supplied by Equifax Marketing Decision Systems, Inc., and illustrates the Jefferson Parish market area resident work force by type of occupation in comparison to employment within Louisiana, and the nation as a whole.

■ PERCENT OF POPULATION...by Level of Education

Education Group	Jefferson Parish Market Area	State of Louisiana	United States
Non-High School Grad.	37.1%	42.3%	33.5%
High School Graduate	32.0%	30.9%	34.6%
Some College	14.8%	12.8%	15.7%
College Graduate	16.2%	13.9%	16.2%

FIGURE 1.8

Source: Golf Resource Associates; Equifax Decision Systems, Inc.

As the graph and table in Figure 1.9 illustrate, over 26 percent of the residents in the market area work force tend to be employed in professional or managerial positions—the type of employment which generally produces the highest incidence of participation in golf.

In comparison, nearly 24 percent of Louisiana residents, and 25.7 percent of the nation's work force, fall within the definition of the professional and managerial employment categories.

Market area employment in clerical and sales positions (30%) the next highest category of golf participation by employment type, is also significantly higher than the Louisiana (24.4%) and the U.S. (27.3%) averages for this employment category.

In total, it is estimated that over 56 percent of the residents in the Jefferson Parish market area are employed in the two employment categories—professional/managerial and clerical/sales—which typically produce those who demonstrate the greatest tendency to participate in golf. In comparison, it is estimated that 50 percent of the Louisiana, and 53 percent of the nation's work force are employed in these occupational categories.

The foregoing review, concerning the correlation of employment to golf participation among Jefferson Parish market area residents, indicates that the incidence of participation in golf among the area's residents, based solely on the type of employment in

■ PERCENT OF WORK FORCE...by Type of Occupation

Type of Occupation	Jefferson Parish Market Area	State of Louisiana	United States
Professional/Managerial	26.2%	23.8%	25.7%
Clerical/Sales	30.0%	26.2%	27.3%
Blue Collar	38.9%	44.6%	42.5%
Other	5.0%	5.4%	4.5%

Source: Golf Resource Associates; Equifax Decision Systems, Inc.

which they are engaged, is likely to be significantly higher than that of the typical Louisiana resident.

- Summary

A review of the foregoing market area demographic and socioeconomic characteristics, and relating statewide comparative data, indicates that it can be reasonably assumed that the potential incidence of golf participation among residents of the defined Jefferson Parish market area, given typical levels of public golf accessibility, is likely to be considerably higher than the average rate of golf participation among Louisiana residents as a whole.

☐ Jefferson Parish Market Area Golf Participation Potential

Once the probable tendency of the local population to participate in golf has been determined, as has been accomplished in the foregoing discussion concerning the characteristics of those who reside within the Jefferson Parish market area, it is necessary to further review resident golf participation in terms of the potential demand that could be created by market area residents. The following discussion provides a brief review of market area population size and growth trends and interprets this data in terms of potential golf participation among the market area's resident population.

- Size of Resident Population

According to population data generated by Equifax Marketing Decision Systems, Inc., recently released 1990 Census data reveals that the Jefferson Parish market area population currently (1990) equals 1,058,362 residents, which represents an decrease of approximately 60,000 residents since the 1980 Census Bureau estimate.

Given current growth trends, EMDS, Inc. has projected that the resident population within the Jefferson Parish market area, as defined by GRA, will fall to approximately 1,046,710 residents by 1995. Figure 2.0 (following page) is based upon EMDS, Inc. estimates and projections and illustrates past (1970 and 1980), current (1990), and anticipated (1995) population growth within the defined Jefferson Parish market area.

Figure 2.0 also illustrates the current and projected growth of the Jefferson Parish market area in comparison to the rate of growth for Louisiana as a whole. As the population data indicates, both the market area (10.0%) and Louisiana (15.5%) experienced an increase in population during the 1970 to 1980 period.

Based on current estimates and projections, the growth rate within the defined market area fell well below the Louisiana rate during the 1980 to 1990 period, and it is projected to continue to decline at a greater rate than Louisiana as a whole through 1995. It is

projected that the defined market area will experience an estimated 6.4 percent decline in population during the 1980 to 1995 period while, in turn, it is projected that the Louisiana population will increase by nearly 1.4 percent in the same period.

• Resident Golf Participation

During 1985, Market Facts, in cooperation with the National Golf Foundation, completed what was then considered to be the most extensive golf participation survey ever conducted.

The survey, *Golf Participation in the United States*, indicated that the incidence of participation in golf among U.S. residents, five-years-old and older, was approximately 8.0 percent.

Repetition of the survey in subsequent years has revealed consistent increases in participation from the initial 8.0 percent to the most recent findings (published June, 1990) which indicate that the rate of participation in golf within the nation's age-five and older population now equals 10.8 percent.

On a state-by-state basis, the most recent survey found that golf participation was greatest among the residents of Minnesota (17.6%), and lowest in Mississippi, where only 4.4 percent of the residents played the game. According to the Market Facts' survey, the average rate of participation among the five-year and older resident population in Louisiana is estimated to be 5.4 percent. The estimated rate is the second lowest rate of statewide golf participation in the United States behind only Mississippi.

As previously expressed, based on a comprehensive review of the socioeconomic characteristics of the population in the defined Jefferson Parish market area, GRA estimates that the potential incidence of participation in golf among market area residents is significantly higher than the rate of participation among Louisiana residents as a whole. For the purposes of market area golf participation estimates and projections within this report, it is assumed that the rate of golf participation among Jefferson Parish market area residents is equal to 6.0 percent of those residents who are of age-five or older.

The resident golf participation estimates included in Figure 2.1 are based upon the foregoing estimated rate of potential golf participation among Jefferson Parish market area residents, and depict the estimated potential number of resident golf participants as per 1970 and 1980 Census Bureau estimates, and 1990 and 1995 population estimates and projections generated by Equifax Marketing Decision Systems.

As the table in Figure 2.1 indicates, the Jefferson Parish market area currently contains a potential of over 58,000 residents who may participate, either actively or casually, in the game of golf. By 1995, as-

ESTIMATED RESIDENT GOLF PARTICIPATION

Estimated Resident Golf Participants: Jefferson Parish Mkt. Area

<u>Year/Basis</u>	<u>Estimated Resident Population</u>	<u>Estimated Golf Participants</u>
1970 Census	1,016,080	56,082
1980 Census	1,117,980	61,706
1990 Estimate	1,058,362	58,415
1995 Projection	1,046,710	57,772

FIGURE 2.1

Source: Golf Resource Associates; Equifax Decision Systems, Inc.

suming the golf participation rate remains static, the market area could potentially contain slightly less than 58,000 resident golf participants.

☐ **Jefferson Parish Market Area Public Golf Demand Potential**

Determining public golf demand potential, requires further refinement of the foregoing participation estimates and expression of these estimates in terms of the potential number of public golf facility users which may live in the defined market area. Public golf market demand potential is most easily expressed in terms of the total number of rounds of play that could potentially be generated within the market area in comparison to the number of rounds of play that are, or will be, accommodated by existing or planned public golf facilities.

• **Resident Public Golf Demand Potential**

Through the research efforts of organizations such as Market Facts and the National Golf Foundation, relatively current information pertaining to how often golfers participate and where they most often play is available. Market Facts, for instance, has found that although public facility golfers account for approximately 77 percent of the nation's total golf participant population, that the public to private golfer ratio can vary significantly according to U.S. region and on a state-by-state basis.

On a regional basis private golf is strongest in the South, while public golf accessibility and participation is more prevalent in the North Central region of the nation. At the state level there is a wide variance in the degree of influence exerted by public facility and private club golf participants. In Wisconsin, for example, approximately 88 percent of the golf population participates at public golf facilities, while in Georgia only 49 percent of all golfers participate at public golf facilities. In Louisiana, it is estimated that 51 percent of the state's golfers participate at public golf facilities.

In general, most researchers categorize golf participants as either active or casual, depending on their frequency of play. Since it is the active golfer who is usually responsible for the preponderance of play at any given golf facility (the Market Facts survey indicated that on a nationwide basis, 22% of the golf par-

■ ESTIMATED FREQUENCY OF GOLF PARTICIPATION

<u>Level of Golf Participation</u>	<u>Annual Frequency of Participation</u>	PERCENT OF PARTICIPANTS	
		<u>United States</u>	<u>W. South Central Region Average</u>
Infrequent	1 - 2 Rounds	21.0%	21.5%
Occasional	3 - 7 Rounds	30.1%	28.9%
Average	8 - 24 Rounds	26.6%	24.1%
Frequent	25 or More Rounds	22.3%	25.5%
Mean Annual Play Frequency (Rounds)		19.2	25.4

FIGURE 2.2

Source: Golf Resource Associates; Market Facts, Inc.

ticipants account for approximately 72% of all rounds played), it is important when estimating the potential number of rounds which may be generated within a market area, that consideration be given to the number of active and casual golfers and how often they participate.

Figure 2.2 (previous page) identifies golf participants by four major levels of participation involvement and illustrates the overall findings of the Market Facts survey concerning the frequency of play for golf participants in the United States and the average participation involvement between the nation's West South Central region.

The estimated play frequency of the typical Louisiana (24.5 rounds) golf participant is nearly one round lower than the region (25.4 rounds) average, yet is over five rounds higher than the U.S. (19.2 rounds) average.

Based upon the foregoing review of market area socioeconomic characteristics, and considering the age structure of market area

ESTIMATED ROUNDS OF PLAY POTENTIAL

Jefferson Parish Market Area Public Golf Participation

Note: The estimated frequency of play is based on an average frequency rate of 24.9 annual rounds of play factored to an average of 22.2 rounds per typical levels of public golf participant frequency. "Estimated Market Area Participants" are based on a market area participation rate of 6 percent. "Estimated Private Participants" are equal to approximately 49 percent of the golf population. "Estimated Public Participants" are equal to approximately 51 percent of the estimated golf population. "Potential Rounds of Public Golf" are equal to the estimated potential number of public golf participants (X) the corresponding estimated frequency of play category. Small errors in totals are possible and are the result of rounding an extensive number of calculations. These errors have an insignificant impact on total market area estimates and projections and should be disregarded.

FIGURE 2.3

Source: Golf Resource Associates; Equifax Decision Systems, Inc.

residents (the nation's most frequent players fall into the 55 years and older age categories and represent 18% of the Jefferson Parish market area as compared to 17.9% of the Louisiana population), the average frequency of play for all market area golf participants is estimated to be 24.9 annual rounds.

Figure 2.3 (previous page) provides further refinement of the Jefferson Parish market area resident golf population in terms of the existing and projected estimated number of public and private golf participants. The table in Figure 2.3 also indicates, based upon the estimated number of annual rounds of play the typical Jefferson Parish market area golf participant is likely to generate, the number of rounds of play which could potentially be generated by the market area's public golf participants.

The public rounds of play frequency has been factored to reflect Market Facts' findings which indicate that public golf participants tend to participate somewhat less frequently than their private club counterparts. The estimated and projected market area rounds of play potential is not based upon the existing or projected availability of public golf facilities, but solely on those participation level and frequency of play factors which have been discussed.

As the table in Figure 2.3 indicates, based on Louisiana public to private golfer ratios, it is estimated that the Jefferson Parish market area, in 1990, could have contained a potential of nearly 30,000 public golf participants. Based on market area population growth data, it is anticipated that there will be approximately 300 less resident public golf participants by 1995. And, based on available data, it is estimated that the market area's resident public golf population, given adequate public golf facility accessibility, could potentially generate nearly 550,000 rounds of play by 1995.

• **Visitor Public Golf Demand Potential**

Although it is always difficult to accurately measure the potential impact of visitor golf participation within a specific market area, if estimates pertaining to the potential number of visiting golfers are based upon reasonably accurate estimates of the total visitor population and are factored by conservative estimates of probable golf participation as related to reliable research data, it is possible to make reasonable assumptions concerning the probable number of visitors who may participate in golf during their stay within the market area.

Estimates pertaining to potential market area visitor golf participation are based upon visitor population estimates provided by various sources including, the Greater New Orleans Tourist and Convention Commission and the Greater New Orleans Hotel/Motel Association. These sources indicated that the Greater New Orleans area annually accommodates 6 million visitors.

If U.S. averages for the age-five and older (92.5%) population, the rate of golf participation (10.8%), and frequent golfer (22.3%) categories are applied to develop a golfer profile among this national visitor/tourist/convention population of 6 million, it could reasonably be estimated that nearly 135,000 additional golfers could be visiting the defined market area on an annual basis. If one-half of these potential golfers were to play one round of golf during their stay in the area, nearly 70,000 additional rounds of play could be added to the unserved market demand potential.

It should be noted that GRA estimates of potential golf participation among the visitor/tourist/convention population reflects a somewhat conservative perspective. While this population segment represents some 6 million potential golfers, GRA estimates that only slightly more than one percent will play a round of golf during their stay in the area. If the facility is properly marketed, this segment of the potential golf market could significantly affect the viability of the proposed facility, and if the Jefferson Parish municipal golf facility were to be developed, this opportunity should be fully exploited.

Unserved Market Demand

To determine the extent of unserved market demand potential—the annual number of public golf rounds of play which should be available for absorption by the proposed Jefferson Parish golf facility—it is necessary to determine the level of public golf demand that is, or will be, accommodated by the market area's existing and, if any, planned public golf facilities.

The following discussion includes a review of those golf facilities which currently serve the defined Jefferson Parish market area, and provides a review and evaluation of the proposed facility's market opportunities in terms of the potential availability of surplus, or unserved market demand.

☐ **Jefferson Parish Market Area Golf Facilities**

To ascertain current golf facility operating characteristics and conditions, including actual or estimated levels of play accommodated, on-site interviews were conducted with personnel at public and private golf facilities within and beyond the defined Jefferson Parish market area.

Figure 2.4 (following page) illustrates the approximate location of golf facilities visited by GRA and the approximate location of other public or private golf facilities in or near the defined market area. In conducting the on-site research for the proposed Jefferson Parish, GRA did not find evidence of planning for the development of any additional public golf facilities within the defined market area.

1990

FIGURE 2.4

Source: Golf Resource Associates, Inc.

A review of selected market area golf facilities, including fee structures and other operating characteristics follows. Although golf facility information contained within this report is based upon data which was made available to GRA during the on-site facility interview process, it should be noted that it is not uncommon for golf facilities to alter fee structures or change operating policies. As a result, it is not possible to pro-

vide total assurance that the future operating characteristics of the facilities will be as reflected in the following review of market area facilities.

Audubon Park GC

Comments:

Audubon Park is a short, regulation length municipal golf facility located in heavily populated New Orleans, west of the Central Business District..

The quality of the golf course is adequate, although the two story clubhouse needs esthetic improvements.

Entrance to the facility is through an older neighborhood on the west side of the park. The parking lot is small and inadequate for this size of a golf operation. The facility is owned and operated by the City of New Orleans, yet records pertaining to rounds of play and operating performance were not readily available at the time of the GRA visit.

18 holes	15.00
27 holes	24.00
36 holes	30.00

Comments:

City Park is a four golf course complex.

A local management company owns and operates the golf shops and collects golf fees for the state. Three courses are operated out of the main clubhouse while the driving range complex has a separate control center across the street from the main clubhouse.

A small golf shop is set up in a park administrative building to control the fourth golf course which is an executive length golf course. Due to very low green fees, play at City Park is heavy virtually year round.

There has been discussion recently concerning the donation of funds for a substantial upgrade to City Park's best facility, The Championship Course. Specific details of this plan were not available.

The four courses at City Park benefit from the central location which is convenient and accessible to golfers in the metropolitan area. Affordable daily green fees, as well as annual passes make this the busiest golf facility in the area. Prime playing times are weekend mornings and weekdays after 3 P.M. The facility operators are quite actively involved with hotel, tourist, and convention planners to coordinate convention and corporate golf tournaments and outings.

Bayou Barriere
Belle Chasse, Louisiana

Type of Facility: 27-hole, regulation length, daily fee
Estimated Annual Rounds of Play: 55,000

Fee Structure:

Green Fees:

18 holes/Monday	\$13.00
18 holes/Tuesday-Friday	16.00
18 holes/Weekends	22.00
Twilight/Weekdays	13.00
Twilight/Weekends	16.00

Golf Car Rental

18 holes	\$18.00
----------	---------

Comments:

Bayou Barriere is a 27-hole facility that was operated as a private non-equity club until it was purchased by the Jim Colbert Golf Management Company approximately four years ago. Colbert has since sold the operation, in part due to unsatisfactory operating results.

The new owners are in the process of constructing a new clubhouse which should be completed by Fall, 1991. Access to the existing clubhouse is poor, as golfers currently must travel under a bridge, over a railroad track, and then travel on a gravel road to an unpaved parking lot. Currently there are no plans to improve the course access roads or parking.

Brechtel Memorial Park
New Orleans, Louisiana

Type of Facility: 18-hole, regulation length, municipal
Actual Annual Rounds of Play: 44,500

Fee Schedule;

Green Fees:

Weekdays (All Day)	\$5.75
Weekdays/Seniors-Juniors	4.25
Weekends (All Day)	7.00

Annual Fees

Individual	\$400.00
------------	----------

Golf Car Rentals

18 holes	\$16.00
----------	---------

Comments:

Brechtel Park is a reasonably good quality municipal golf course which has, like all other municipal golf facilities in the New Orleans area, a fee structure that is extremely low. The facility is located on the West Bank, and enjoys good access and parking. The clubhouse is quite small, yet is very functional.

Plantation Golf and Country Club

Behrman Highway

Gretna, Louisiana

Type of Facility: 18-hole, regulation length, daily fee

Estimated Annual Rounds of Play: 24,000

Fee Structure:**Green Fees:**

Weekends

\$6.00

Weekdays

5.00

Golf Car Rentals

18 holes/Weekdays

\$11.00

18 holes/Weekends

13.00

Comments:

Plantation Golf and Country Club is a short, regulation length facility also located on the West Bank. Despite it's excellent location, this facility is not one of the better public golf facilities in the immediate New Orleans area.

The course was owned until recently by American Golf Corporation. The current owners, unlike their predecessors, have been promoting the facility for outings. According to management staff, weekend outing play has driven away some of the regular green fee players.

• Facility Operating Characteristics

Research by the PGA of America and the National Golf Foundation has indicated that the nation's typical 18-hole municipal golf facility accommodates approximately 50,000 annual rounds of play. Additional information obtained from PGA/NGF research indicates that 18-hole daily fee and 18-hole municipal golf facilities in the nation's West South Central Region, on average, also tend to accommodate approximately 50,000 annual rounds of play.

GRA investigation of publicly accessible golf facilities in the Jefferson Parish market area, indicates that a typical 18-hole municipal golf facility, given average weather conditions, should accommodate approximately 45,000 to 50,000 rounds of play during a typical operating year of approximately 310 to 340 playable days.

☐ Unserved Demand Potential

As previously discussed, GRA estimates that the potential size of the current Jefferson Parish market area, in terms of potential resident public golf play, could exceed 540,000 annual rounds of play. The projected 1995 potential resident public golf play within the market area is estimated to fall below the 540,000 annual round level.

An additional segment of market demand potential which must be considered, and which is likely to have an effect on public golf demand, is the private golf participant who will occasionally travel to a public golf facility to play a round of golf. Because this segment of market demand potential represents a significant share of the overall level of public golf demand potential (537,176 rounds of play), its impact on play is very important to gaining an understanding of this golf market.

Figure 2.5 (following page) depicts the estimated public rounds of play potential generated by the resident population within the Jefferson Parish market area in 1990 and 1995; rounds of play which could be contributed by the visitor/tourists populations; and, the rounds of play that may be derived from private golfers who may occasionally play at a public golf facility. In addition, the table depicts the existing and projected number of rounds of play which are, or should be, absorbed by existing and planned market area golf facilities, and shows, in terms of unserved public golf demand, the extent of market potential that should be available for absorption by the proposed Jefferson Parish golf facility.

• Summary

The market potential for a public golf facility in the Jefferson Parish market area, based on the level of support which might be derived from the estimated existing (1990) and future (1995) resident public golf market demand potential, only slightly

exceeds (53,020 current and 46,646 projected) the annual rounds of play that would normally be accommodated (45,000 to 50,000 rounds) by a market area 18-hole public golf facility. This would seem to indicate that the resident public golf population is currently well served by existing market area public golf facilities.

There are, however, various other golf participation segments which must also be considered. A segment of golfer whose potential contribution to the overall market demand potential which has not been quantified is the "unaccommodated" private golf participant. Typically, this golf participant is classified as a private golfer, but has elected not to participate at a private golf facility for various reasons.

Because of the nearly equal division of public (51%) to private (49%) golfers in Louisiana, it is entirely possible that this segment of market demand potential could be much more substantial than in other states and other golf markets. Although difficult to quanti-

Total Estimated 1995 Public Golf Unserved Market Demand Potential		116,646

Note: GRA estimates of rounds played are provided when actual rounds of play could not be determined. (A) Although GRA has typically found actual rounds of play data to be readily available at most municipal golf facilities, research of public golf facilities in the New Orleans area did not reveal the presence of such data.

FIGURE 2.5

Source: Golf Resource Associates; Market Facts, Inc.

fy, it is likely that many of the market area's potential golf participants who have been identified within this report as "private" golfers could be included within the public golf market demand potential. This type of golfer will most likely require facilities and amenities that far exceed the quality of facilities found at most of the existing New Orleans municipal golf facilities.

In addition, it is important that the tourist/visitor/convention golf participation segment be considered. According to local sources, this industry has always thrived in the New Orleans area, and various local tourism officials responded favorably to questions concerning the use of golf as a marketing tool to encourage a visit to the New Orleans area. It is important to note, however, that New Orleans is not viewed as a resort community and is not promoted as such.

While visitors do not come to the area for the express purpose of playing golf, it is one of the amenities most often listed by convention/meeting planners when inquiring about a possible convention site. The presence of a municipal golf facility should assist in attracting additional business travelers to Jefferson Parish. This segment, in similarity to the desires of the unaccommodated private golf segment, is also best served through the development of a quality municipal golf facility.

While the potential of the convention/tourist business is significant, it is not generally advisable to develop a municipal golf facility solely on the basis of potential rounds that could be derived from visitor populations. A Jefferson Parish municipal golf facility should primarily serve as a recreational amenity for residents of the Parish. It would also be available to the tourist, convention, and business traveler market as an added incentive to utilize the convention and motel/hotel facilities of Jefferson Parish. Properly promoted, the proposed Jefferson Parish municipal golf facility could possibly attract regional, state, and national golf tournament events as well.

Given the development of a publicly accessible golf facility of equal or greater quality to the area's existing public golf facilities, it is reasonable to assume that the proposed Jefferson Parish facility would capture a portion of the rounds of play that are now accommodated by existing market area facilities. This is particularly true in the early years of operation when most golfers, who tend to be nomadic by nature, will experiment with a new golf facility. Although this may have a negative short-term impact on these golf facilities, the long-term benefits that are typically associated with new public golf facilities in the market could be significant.

As the accessibility to public golf within the Jefferson Parish market area expands, so too should the rate of public golf participation among market area residents. Research by Market Facts' indicates that there is a direct correlation between public golf accessi-

bility and the incidence of participation in golf. The firm's research has shown that as local public golf accessibility expands, the expansion is generally followed by a similar expansion in the resident public golf participation rate.

Although the success of any golf facility is always highly dependent upon the qualifications, experience, and effectiveness of the facility's on-site management, given the proposed facility's type, size, and anticipated quality, it is the opinion of Golf Resource Associates that the actual rounds of play accommodated by the proposed facility could equal 45,000 to 50,000—an annual level of play that should be typical of a well-managed and, in terms of user fees, affordable 18-hole municipal golf facility in the Jefferson Parish market area.

In summary, it is the opinion of Golf Resource Associates that the overall level of demand for public golf in the Jefferson Parish market area, is sufficient to warrant further exploration of the feasibility of developing the proposed Jefferson Parish municipal golf facility. It is important, however, given the extremely competitive fee structure at the area's existing municipal facilities, that the long term economic viability of the project be fully explored.

APPENDIX B

**ROBERT CHARLES LESSOR
MARKET ANALYSIS AND DEVELOPMENT STRATEGY AND
UPDATE FOR 367 ACRES ADJACENT TO NEW PUBLIC
GOLF COURSE; METAIRIE, LOUISIANA**

ROBERT CHARLES LESSER & CO.
REAL ESTATE ADVISORS

DATE: October 17, 1994 02-4680.03
TO: MR. THOMAS CARRERE
FROM: ROBERT CHARLES LESSER & CO.
SUBJECT: Market Analysis Update Analyzing the Need for 367 Acres to be Developed
Adjacent to a Proposed Public Golf Course; Metairie, Louisiana

Pursuant to our proposal-agreement dated September 2, 1994, we are pleased to present this memorandum summarizing our findings, conclusions, and recommendations relative to the above subject. This memorandum represents an update of our previous study, completed in December of 1992 (02-4680.00).

SUBJECT PROPERTY

- The subject property, known as Estelle Plantation, is located on Lafitte Larose Highway, a north-south four lane artery that extends from Barataria Boulevard and bisects the property. The site is within Jefferson Parish on the West Bank of the Mississippi River.
- Land uses surrounding the subject property have not changed much in the past two years since our original study of the market:
- To the north and west of the subject site are concentrations of low to lower middle income housing. These homes are mainly single story brick ranches in the \$50,000 to \$75,000 price range. According to the University of New Orleans, the average

MR. THOMAS CARRERE

02-4680.03

October 17, 1994

Page 2

home price in the Estelle area has ranged from \$58,842 to \$70,151 since 1987. This suggests a lack of middle to upper end housing in the area¹, which is critical to the area's long-term economic viability.

- Two older, fully developed communities, Stonebridge (which includes a golf course) and Plantation Estates provide executive housing in the area, with home prices generally ranging from \$150,000 to \$400,000. Barkley Estates, located on Lapalco Boulevard, is a newer upper-end community that recently began selling lots in the \$35,000 to \$55,000 range (sales started in January 1994).
- The Belle Promenade Mall, a regional shopping center located to the north of the property at the intersection of Lapalco and Manhattan Boulevards, is the location of the nearest retail and commercial concentration. These retail and commercial services will serve the future residents of the Estelle Plantation.
- Land due south and east of Estelle Plantation is currently undeveloped. Some of the parcels are privately owned with the remainder owned by the National Wildlife and Forest Reserve.
- The proposed golf course will be a municipal course, developed on approximately 175 acres donated to the Parish. Historically, both public and private golf courses have the ability, if well designed and maintained, to increase the value of surrounding residential land. This is due to the limited supply of amenity-oriented housing in the New Orleans area, and the strong interest among consumers in such housing. Examples of this include Stonebridge and Beau Chene, which are largely built-out.

¹ It should be noted that Barkley Estates is included in the Estelle survey area, but none of its sales occurred in the survey time frame. With these figures added, the average home price and price per square foot range is actually higher. The apparent success of Barkley Estates demonstrates that executive and middle management housing in the area is a viable option for the Estelle Plantation.

Page 3

ECONOMIC OVERVIEW

- Local and regional economic expectations provide the relative context for future housing needs in the market area, as summarized below.
- While much of the nation has recovered from the 1991 economic recession, the recovery has occurred slowly in the New Orleans Metropolitan Statistical Area (MSA)². Jefferson Parish and the West Bank Competitive Market Area (CMA)³ are experiencing a stronger recovery compared to other parts of the MSA in terms of population and employment growth.
- Expectations are that the lack of land for new housing in parishes that received stronger growth in the last growth cycle (Orleans and St. Tammany) will contribute to the need for new housing and employment venues in the West Bank area during the current growth cycle.
- The West Bank CMA currently attracts nearly 44% of all population growth in the New Orleans MSA. This trend is expected to continue until 1999.

² The New Orleans MSA includes Orleans, Jefferson, St. Tammany, St. Charles, St. Bernard, and St. John the Baptist Parishes. Estelle Plantation is located in Jefferson Parish.

³ The West Bank CMA for population purposes is defined as: Jefferson Parish south of the Mississippi River, north of Louisiana Highway 301, and east of the Bayou Signette and Dugues Canals.

ROBERT CHARLES LESSER & CO.

MR. THOMAS CARRERE

02-4680.03

October 17, 1994

Page 4

Population and employment growth trends are projected to be stronger in the 1994 to 1999 period than they were in the 1990 to 1994 period. This is especially true for employment growth in Jefferson Parish.

	EST.	PROJ.	--Ann. Number Change --			--Comp. Ann. Growth--

- Employment growth trends indicate that in terms of job growth, New Orleans has shifted from a trade to a services oriented economy over the past decade. Many of the area's service businesses are tourist and visitor-oriented. These include the hospitality and retail trade sectors.
- Conventions, Mardi Gras and other amusements, including the newest industry in New Orleans -- gaming -- are also visitor oriented. In New Orleans alone, it is expected that 450,000 square feet of gaming area in ten facilities will be open by 1995. These figures do not include Riverboats or facilities on the Gulf Coast.

ROBERT CHARLES LESSER & CO.

MR. THOMAS CARRERE

02-4680.03

October 17, 1994

Page 5

- The new gaming venues are expected to generate a substantial number of new jobs, and create a need for new housing potentially above what had been previously forecasted by regional planning agencies.
- The oil industry has historically been an important part of the New Orleans economy. Its decline has been associated with New Orleans' overall economic prospects. Oversupply has continued to depress oil prices worldwide. A 1992 environmental law places a \$150 million bonding liability on offshore wells by 1996. Very few private firms say they can meet this requirement. Therefore many wells may be closed (should this have the effect of constricting supply and raising oil prices, the industry may be helped, though there will still be fewer oil-related jobs).
- Employment trends for the New Orleans MSA are reflected in the employment patterns of Jefferson Parish. However, oil is not as important to Jefferson Parish as in other areas of the MSA. The services sector accounts for one out of every three jobs in Jefferson. According to the Federal Reserve Bank of Atlanta, New Orleans has more health, education, and legal services as a percentage of employment than other states in the Southeast. Retail trade is the second most important sector in the Parish.
- It is possible that port facilities may eventually move to expand out of Orleans Parish due to its relatively antiquated facilities to areas with less expensive land which can accommodate ships as well as barges. Jefferson Parish is a likely candidate for such a relocation, which would create additional demand for housing in the Parish.
- The following table illustrates how Jefferson Parish has evolved in terms of non-farm employment distributions.

MR. THOMAS CARRERE

02-4680.03

October 17, 1994

Page 6

**The Service Sector has Clearly Replaced Trade as the
Dominant Industrial Sector, While Other Sectors Remain
Unchanged or in Decline**

Source: National Planning Association

- It is important to note that export industries such as finance, insurance, and real estate are under-represented in the New Orleans MSA, as compared to their percentage of employment in other metro areas.
- Service sector and retail trade jobs are typically lower wage than other sectors, such as finance, insurance, and real estate. This indicates that as new jobs arise in these sectors, a greater demand for housing will be for more moderately priced product, predominately under \$200,000.
- In 1994, new single family residential units authorized by building permit are expected to reach their highest levels since the mid 1980's. Single family permits have yet to approach the peak of that time period, but overall trends indicate that the single family market is improving greatly compared to the late 1980's and early 1990's. Multifamily permits indicate that the multifamily sector has not yet recovered.

ROBERT CHARLES LESSER & CO.

Total	39.5%	43.3%	33.6%	30.9%	26.1%	26.6%	24.1%	23.6%

- Population and income measures indicate that homeowners in the New Orleans MSA, Jefferson Parish, and the West Bank CMA are becoming both wealthier and older. In New Orleans and the West Bank, the percentage of households earning more than \$35,000 was 34% in 1994. Forecasts predict that by 1999 50% of these households will earn at least this much.
- In absolute numbers, the 35 to 44 age range has become the largest in New Orleans, Jefferson Parish, and the West Bank CMA, replacing the 25 to 34 age range. Currently, 35 to 44 year olds comprise 24% of New Orleans population, declining to 23% in 1999. In West Bank, the percentage is expected to rise from 26% in 1994 to 27% in 1999.
 - The propensity to purchase upgrade and move-up housing is high among the age ranges of 25 to 34 and 35-44, especially among married couples with children. National trends, wherein married couples with children comprise 60% of all move-up buyers and 54% of all new home buyers, are reflected in the market profiles of New Orleans home buyers. Based on the statistics

Page 8

presented in the preceding paragraph, we conclude that Estelle Plantation should market neighborhoods to these demographic segments.

- As shown in the following table, New Orleans Metro home prices have risen 12.9% in the last six years. Over the same period, Jefferson Parish home prices have appreciated almost twice as much. Most of its upper end housing is located in Old Metairie.

Jefferson Parish Home Prices Have Appreciated Almost Twice as Much as the New Orleans Metro Area Overall						
PARISH	1987 AVERAGE HOME PRICE	1990 AVERAGE HOME PRICE	1991 AVERAGE HOME PRICE	1992 AVERAGE HOME PRICE	1993 AVERAGE HOME PRICE	1993-87 PERCENT CHANGE

COMPETITIVE MARKET

- The Competitive Market Area (CMA) is the geographic area within which residential projects and commercial developments will compete for available consumer demand on a more or less equal basis. The CMA encompasses all of Jefferson Parish south of the Mississippi River, north of Louisiana Highway 301, and east of the Bayou Signette and Dugues Canals.

ROBERT CHARLES LESSER & CO.

MR. THOMAS CARRERE

02-4680.03

October 17, 1994

Page 9

- The metro New Orleans residential real estate market has recovered from the 1991 recession. According to the University of New Orleans Real Estate Market Data Center, a record \$871 million was spent on new and resale homes in 1993. Over 9,100 homes were sold in 1993, the greatest number in the past decade.
- According to Dr. Wade Ragas at the University of New Orleans, continued low interest rates, the lowest in 30 years, fueled the housing recovery. A renewed confidence of the home buying public was also beneficial. In addition, he states that as of mid-year 1994 there was less than one year's supply of new housing currently on the market.
 - Home prices in the metro area have been expected to rise as supply becomes more constricted. Due to a lack of land in New Orleans, especially large tracts, a building surge is not expected in response to the improved supply/demand conditions. These very favorable conditions for new development may create an opportunity for the subject site to capture more than its fair share in residential sales, over the long-term.
- Eight projects within the New Orleans MSA which are judged to be competitive to the subject property were surveyed. Among the projects surveyed were competitive planned unit developments with golf courses and selected single-family subdivisions located in Jefferson Parish. Surveys indicate that the more successful large scale projects are moderately priced or have moderately priced product offered along with more expensive housing.
 - Greenleaves and the Ormond Country Club are successful golf oriented projects located on the north and west side, respectively, of Lake Pontchartrain. These developments have historically sold ten and eight homes per month, respectively. Both of these projects offer distinct neighborhoods and were developed in phases. More expensive housing was offered once the projects had established themselves relative to the market.

ROBERT CHARLES LESSER & CO.

MR. THOMAS CARRERE

02-4680.03

October 17, 1994

Page 10

- The two most expensive new home communities in New Orleans, English Turn and Eastover, have experienced somewhat slower sales than the more moderately priced communities, with an annual absorption of 52 and 36 homes, respectively. These two golf-oriented communities do not offer any moderately priced housing, aside from cluster homes, along with executive housing.
- New home prices in the competitive market range from \$50,000 (a 900 square foot condominium) to over \$2,000,000 for a 15,000 square foot mansion.
- Lot prices in the competitive market range from \$20,000 on a 7,700 square foot lot to \$275,000 for a 168,692 square foot parcel .
- While many existing homes in the area are priced much lower, prices for the majority of homes in surveyed active new developments are between \$150,000 and \$300,000. Average lot price is between \$35,000 and \$65,000 and sizes for the majority of lots sold is between one-third to one-half of an acre.
- Lot to home ratios for the most successful projects average between 18% to 25%. English Turn and Eastover have higher lot to home ratios, but are priced at the very high-end of the market.
- Buyers in most new communities surveyed are largely between the ages of 30 to 45. Many of these buyers are families with young children. Some empty nesters are drawn to golf course communities because of the prestige associated with such developments, and the fact that their evolving lifestyle allows them more time for recreational pursuits like golf.
- According to sales agents interviewed, buyers are motivated to purchase by a "good value", especially in perceived secure areas outside of the city, as expressed in terms of lot size, home size, and quality for the price.

MR. THOMAS CARRERE

02-4680.03

October 17, 1994

Page 11

- The most successful projects in our survey will be sold out of developer offered lots and homes within one to two years. Indicating a need for new development at the subject property, Barkley Estates, a new home community which is selling well, does not have a golf course, thereby giving the subject site a competitive advantage once its course is in place.
- As available lots sell-out in the historically more popular areas of St. Tammany and the East Bank, demand should increase for housing on the West Bank. Because of the lack of land in St. Tammany and the East Bank areas, other new recreational communities which might begin sales in the next five to ten years would be located approximately an hour drive away from Downtown New Orleans. Commutes from Estelle Plantation are considerably shorter, thereby giving the subject property an advantage.

DEMAND ANALYSIS

- A statistical demand analysis was conducted to evaluate the potential depth of the market and need for lots to be developed for single-family detached homes at the subject site. This analysis is a critical component of determining the need for new housing at Estelle Plantation.
- Lot and home prices analyzed were determined by demographic conditions within the CMA and historical trends in for-sale housing. The mix of lot prices investigated range from \$25,000 to a maximum of \$78,000. Home prices, calculated on the basis of a lot to home ratio in the 18% to 24% range, are \$140,000 to \$310,000. The statistical analysis is consistent with historical market performance of competitive properties and future growth forecasts and trends for the MSA and the CMA.

ROBERT CHARLES LESSER & CO.

MR. THOMAS CARRERE

02-4680.03

October 17, 1994

Page 12

- The need for new single-family homes will be generated from three primary sources:
 - 1) New households - households migrating to the New Orleans MSA or new household formations due to the aging of the population and lifestyle considerations;
 - 2) Owner preference - households within the MSA who presently own their own home but need to buy a new residence due to their family growing with the addition of children or other lifestyle changes (i.e., upgrade, move-up, move-over or move-down buyers);
 - 3) Renter upgrading - households within the MSA presently renting who wish to pursue the "American Dream" of home ownership.
- Factors creating need within the market include expanding families, in-migration, income distributions, home ownership propensity and turnover (i.e., propensity to move in a given year).
- To estimate each income group's propensity to purchase a new home as opposed to a resale home or other product type, an "active market factor" was applied to the qualified groups of potential buyers. This factor, applied to income and home owner qualified households, is based on an analysis of product availability by price range and the percentage of new versus resale home sales by price range in the MSA.
- Total annual new housing need derived from the West Bank CMA within the indicated price ranges is anticipated to be 350 units annually over the next five years. Forty-seven percent of the CMA's total need, or 164 each year, will be derived from new households moving into the West Bank CMA and needing housing in the \$140,000 to \$310,000 price range. Existing households "moving up" will account for another 44%, or 154 households annually. Renter households purchasing their first home will account for about 9% or 31 homes each year.

MR. THOMAS CARRERE

02-4680.03

October 17, 1994

Page 13

- Based on an assessment of the market and competitive alternatives, the subject site may be capable of capturing as much as of 20% of the West Bank CMA's need for new housing (for lots priced from \$25,000 to \$75,000). This capture rate equates to a potential for 76 sales per year, assuming that the property is developed in four separate neighborhoods selling simultaneously (see Exhibit 12).
- This analysis is an estimate of demand of potential by price range. Actual absorption will be affected by such factors as overall economic conditions, the resale market, home mortgage interest rates, existing inventory and competitiveness in the CMA at the time sales activity is engaged, the golf course amenity, and the effectiveness of the marketing strategy employed.

Page 15

CONCLUSIONS AND RECOMMENDATIONS

- The outlook for residential construction activity remains bright for the near future, if:
 - (1) Mortgage rates remain favorable;
 - (2) Inventory levels continue to be depleted;
 - (3) Job growth equals the expectations; and
 - (4) Consumer confidence remains high.
- Based on our understanding of the West Bank CMA, the findings of our survey of actively selling residential properties and the analysis of demographic and socioeconomic trends, we continue to believe that the site can support a lot sales program with lots available in the \$25,000 to \$75,000 range.
- Housing consumers are attracted by the golf course orientation due to the aesthetically pleasing views the golf course provides for many of the homes. In addition, it is anticipated that about 30% of the home buyers will actually be golfers themselves, based on the experience of other golf-oriented communities.

MR. THOMAS CARRERE

02-4680.03

October 17, 1994

Page 16

Fairway Frontage Lots Can Realize Premiums of 50% or More Above Base Prices

Source: Urban Land Institute

- The anticipated strong demand for amenity-oriented housing and historically limited supply suggests that many of the Estelle Plantation lots will be higher priced than they would have been without the golf course. Though the golf-front lots will enjoy the most significant impact, generally all lots within a golf-oriented community enjoy some degree of premium and are positively affected relative to dollar value.
- Our experience with developments nationally demonstrates that golf course communities often attract middle to upper class buyers. As the income profile of a community's residents rises, newer and higher quality retail may follow due to consumer demand. This suggests that the subject property could also have a positive influence on surrounding retail development in the community.
- Higher premiums are achieved for lots and houses in a golf course community versus comparable lots in a non-golf community. A private golf course commands higher lot premiums than lots fronting a municipal course; however, lots oriented to the planned golf course are expected to command significant premiums.
- Based on demographic and socio-economic demand factors, and due to the higher sales rates of golf-oriented communities with "moderately priced" housing, a similar pricing

ROBERT CHARLES LESSER & CO.

MR. THOMAS CARRERE

02-4680.03

October 17, 1994

Page 17

is recommended for the subject property. The community should be developed with four price and product segment neighborhoods. The following table provides a recommended product program for Estelle Plantation:

Product Types:	Approx. Lot Sizes:	Lot Prices:	Home Prices:	Annual Absorption:
Upgrade Production	9,500-10,890	\$25,000 - \$29,000	\$140,000 - \$160,000	32
Move-up Semi-Custom	12,000-13,500	\$33,350 - \$37,950	\$160,000 - \$200,000	24
Exec. Custom Home	14,000-16,000	\$47,250 - \$54,000	\$200,000 - \$240,000	14
Luxury Custom Home	19,000-21,000	\$66,000 - \$75,000	\$240,000 - \$270,000	6
Total:				76
SOURCE: Robert Charles Lesser & Co.				

- The Upgrade Production and Move-up Semi-Custom segments could be sold to one or more merchant builders. The Executive and Luxury Custom Home segments should feature a lot sales program oriented to selected custom home builders (see Exhibit 11).
- Product phasing is designed to achieve high sales absorption and an optimum build-out period. The phasing analysis is based on allocated acreage to a product line and that product's estimated absorption. Infrastructure such as roads and other open space (excluding the golf course) are estimated to occupy 30% of Estelle Plantation's 367 acres, so densities are shown as "net" rather than "gross". It is recommended that the following product phasing be applied to the subject property.

ROBERT CHARLES LESSER & CO.

MR. THOMAS CARRERE

02-4680.03

October 17, 1994

Page 18

Product	Ann.	Total	%	Years====>		
	Acres Absorp.	Acres Alloc.	Acres Alloc.	1-11	12	13
1 Upgrade Production	10.7	117.1	32%	10.7	0.0	0.0
2 Move-up Semi-Cust.	10.0	111.2	30%	10.0	1.2	0.0
3 Exec. Custom Home	7.0	78.5	21%	7.0	1.5	0.0
4 Lux. Custom Home	5.3	60.2	16%	5.3	1.5	0.0
Total	33.0	367.0	100%	33.0	4.3	0.0
SOURCE: Robert Charles Lesser & Co.						

- It is important to note that this phasing analysis assumes four separate neighborhoods, as described above, selling homes and lots simultaneously. Furthermore, it assumes that the land plan results in lots that fit the lot orientations provided above, i.e., that the proportion of golf view, fairway frontage, etc. lots can be achieved by the site plan. To the degree that the final site plan deviates from the plan described above, the annual acreage absorptions shown may not be achieved.
- The highest allocation of acreage is given to the Upgrade Production and Move-up Semi-Custom product segments. Estelle Plantation is well suited to attract buyers in each segment, with the majority of buyers attracted to the product priced under \$200,000.
- We appreciate the opportunity to assist you with your project. This assignment was conducted by Gregg T. Logan, Senior Vice President and Neel Stacy, Associate.

EXHIBIT 11
SUGGESTED PRODUCT PROGRAM AND TARGET MARKET
SCENARIOS FOR THE SUBJECT PROPERTY

SCENARIO: SINGLE-FAMILY PRODUCT PRICED FROM \$140,000 TO \$270,000

Theme:	Upgrade Production, Semi-Custom, and True Custom Housing. The key to realizing strong sales will be to create four separate neighborhoods within the community, two of which can be sold to one or more merchant builders. The two higher-priced neighborhoods should feature a lot sales program oriented to selected custom home builders.						
Buyer Profile:	Families with children are the most likely buyers. Young couples, empty nesters and some single adults also could be targeted. First-time and upgrade buyers, including transferees new to New Orleans, are more likely to purchase in the West Bank area.						
Buyer Motivations/Sensitivities:	Buyers are looking for "good value" in terms of quality, home size and lot size for the price. They are motivated by quality community; innovative home design; amenities; quality schools; easy access to employment. The golf course, though public, provides a focus for the development and contributes to a community identity while providing a visual amenity.						
Marketing:	Community should be marketed first before the homes. Consumers first buy the community/neighborhood, i.e. the location before deciding upon which house to purchase. Centralized marketing from an information center where prospective buyers are told the "Community Story", i.e. the concept, the lifestyle that is being marketed, will enhance absorption of lots and homes.						
Product Types:	Approx. Lot Sizes:	Lot Frontages:	Lot to Home Ratio:	Lot Prices:	Home Prices:	Home Sizes:	Annual Absorption:
Upgrade Production	9,500-10,890	70-75	18%	\$25,000 - \$29,000	\$140,000 - \$160,000	2,200 - 2,800	32

													18.7

It is important to note that this phasing analysis assumes four separate neighborhoods, as described above, selling homes and lots simultaneously. Furthermore, it assumes that the land plan results in lots that fit the lot orientation descriptions provided above, i.e., that the proportion of golf view, fairway frontage etc. lots can be achieved by the site plan. To the degree that the final site plan deviates from the plan described above, the annual acreage absorptions shown may not be achieved.

SUBJECT: Market Analysis and Development Strategy for 367 Acres Adjacent to New
Public Golf Course; Metairie, Louisiana

MEMORANDUM

I. INTRODUCTION

Robert Charles Lesser & Co. was retained to provide an analysis of the need and development strategy for a 500 acre property in Jefferson Parish, Louisiana, as a site for new residential development. The subject site will incorporate a proposed new 18-hole municipal golf course, to be designed by a top name architect, such as Tom Fazio or Ben Crenshaw, on acreage you donated to Jefferson Parish. To facilitate your final decisions with regard to this development, the market study will be used to determine the following: the opportunities for the non-golf acreage; the optimum mix of residential housing products there; projections of annual sales absorption in a lot sales program; and recommendations in the areas of pricing strategy, market orientation, target market, lot sizes, prices and premiums, and the marketing impact, if any, of the golf course.

In order to accomplish those objectives, we employed a qualitative and quantitative review of development opportunities utilizing both primary and secondary research methodologies as follows:

ESTELLE PLANTATION PARTNERSHIP
December 7, 1992

02-4680.00

1. Physical inspection and evaluation of the subject property with regard to topography, geographic orientation, lay-out of the planned golf course and subsequent views, surrounding land uses, access and environmental issues.
2. General review of economic trends and demographic characteristics of the greater New Orleans market area relative to the need for residential lots and homes. Compilation and analysis of available demographic and socioeconomic data with respect to historical and projected population and employment growth. Review of relevant market research materials previously compiled by our organization for the greater New Orleans market specifically related to residential housing and golf courses.
3. Analysis of for-sale residential developments in the greater New Orleans market in general, but with particular emphasis on the defined Competitive Market Area (CMA) of the subject site. Evaluation of selected existing competitive residential and golf-oriented developments in terms of location, total lots and units planned, inventory profile, absorption trends, pricing structure and premiums, lot sizes, amenities and buyer profiles. This information is supplemented by interviews with real estate professionals and public officials in the area with regard to current market conditions and planned and proposed residential developments.
4. Estimation of future need for new housing at the subject property within a proscribed range of lot and home price variables.
5. Translation of research and findings into recommendations for a development program and pricing strategy.

The following assumptions were critical in the conduct of the analysis:

1. No major national recessions will occur during the absorption period.

ESTELLE PLANTATION PARTNERSHIP
December 7, 1992

02-4680.00

2. Our recommendations are based on field research and present knowledge of the greater New Orleans area as of September 1992 through December 1992. Our research included existing competition and future competition announced to public officials as of this date.
3. The recommended development program assumes constraints of the topography of the land and costs issues as provided to us during the course of the assignment.

II. SUBJECT PROPERTY

A. Site Location

The subject property is located in Jefferson Parish, Louisiana on the West Bank of the Mississippi River. The approximately 500 acre property, referred to as Estelle Plantation, is bisected by Lafitte Larose Highway, a four lane artery that runs north to south through the property from Barataria Boulevard. At the writing of this report, the property owners were discussing with the Jefferson Parish Council the possibility of the placement of Jefferson Parish's first and only public, daily fee golf course on the property. The proposed golf course parcel consists of 175 acres of the 500 acre portion of the property lying east of Lafitte Larose Highway. This land would be donated to the Parish for the development of the proposed golf course. To this end, Jefferson Parish have already engaged golf consultants Golf Resources Inc. to provide a feasibility study of the site as a course facility. The owners also have spoken with several course designers including, but not limited to, Tom Fazio and Ben Crenshaw.

Estelle Plantation is located in the south central portion of the West Bank of Jefferson Parish, a middle income "bedroom" community located within the New Orleans Metropolitan Area. Land within the West Bank of Jefferson Parish is dominated by single family and rental housing, service oriented retail strip centers and regional malls, one to

ESTELLE PLANTATION PARTNERSHIP
December 7, 1992

02-4680.00

four story low-rise office buildings, and light to heavy industrial uses located along the inland canals connecting the Mississippi River and the inland lakes system.

B. Accessibility and Visibility

Estelle Plantation has primary access to the New Orleans Central Business District and other major employment centers on the East Bank via the West Bank Elevated Expressway, Business 90, the new Mississippi River Toll Bridge and the Huey P. Long Bridge. Opening of the new bridge across the Mississippi River has improved regional access to downtown by doubling the capacity of traffic flowing directly into the Central Business District. Access is further enhanced by the expansion of several main artery roads in the area, including Barataria Boulevard and Lafitte Larose Highway, from four to six lane boulevards. Effective commuting time from the subject site to employment centers in the New Orleans Central Business District and downtown Metairie can now be less than thirty minutes under normal driving conditions.

C. Surrounding Land Uses

The Estelle Plantation is surrounded by a wide variety of land uses. North of the site on Lafitte Larose Highway is a concentration of higher density, lower middle income housing. These homes, which border the subject property on its northern and western sides, consist mainly of single story, brick ranch houses in the \$50,000 to \$75,000 price range. The northern, eastern and southern boundaries of the site are surrounded by vacant parcels of privately owned developable land and undevelopable parcels maintained by the National Forest and Wildlife Preserve.

Commercial and retail land uses anchored by Belle Promenade Mall, a regional shopping center, are found due northeast of the subject property at the intersection of Barataria Boulevard and Lapalco Boulevard. Executive housing in the immediate area is represented by one walled community, Plantation Estates, located opposite Belle Promenade Mall, and one golf-oriented community, Stonebridge, located east of the property near the intersection of Lapalco and Manhattan Boulevards.

III. DEMOGRAPHIC AND SOCIOECONOMIC ANALYSIS

The following section reviews current economic conditions for the market area, forecasted growth, demographic and income characteristics of the local and regional market. This data provides a regional framework for assessing future demand for residential single family lots and homes at the proposed site. The potential depth of market for the development of residential lots and homes at Estelle Plantation will be influenced by population and economic growth trends within the West Bank Competitive Market Area (CMA), Jefferson Parish, and the greater New Orleans Metropolitan Statistical Area (MSA).

The area from which most of the demand for new housing at the subject property will emanate is the New Orleans MSA, which includes Jefferson, Orleans, St. Charles, St. John the Baptist, St. Bernard, and St. Tammany Parishes. The competitive market area (CMA) is the geographic area wherein projects compete directly for available demand on a more or less equal basis. The competitive market area for the subject property has been defined as the entire portion of Jefferson Parish lying on the western bank of the Mississippi River (See EXHIBIT 1-C for location).

Population and employment estimates for these areas are shown on EXHIBITS 2 through 6 of the Appendix and are summarized below.

A. Regional Economic Overview

The highly sensitive New Orleans economy is dominated by the energy and tourism industries, and as a result is affected severely during periods of low energy prices. As this report is written, New Orleans is slowly recovering from the national recession while still struggling to fully recover from the regional economic and real estate depression that occurred during 1985 to 1987. The plunge in oil prices to very low levels that occurred in the mid-1980's caused mass lay-offs and extensive consolidation among oil industry companies.

ESTELLE PLANTATION PARTNERSHIP
December 7, 1992

02-4680.00

The New Orleans economy grew by 3,100 new jobs during the past year, down by more than 50% from 1990. However, that downturn pales when compared to the annual loss of 13,000 to 16,000 jobs that occurred in the area during the oil recession of 1985 to 1987, and similar job losses during the last national recession in 1982. In comparison to other major metropolitan areas, our research shows that New Orleans metropolitan area fared well by having some positive job growth. In the last two years many metro areas have suffered from no growth or severe net job losses (1990 and 1991). Job growth and stabilization in the New Orleans area was enhanced somewhat by the slight increase in oil prices worldwide during and following the Persian Gulf War. Further consolidation and lagging demand within the oil industry could negatively affect job growth within the metropolitan area over the next decade.

New Orleans is only now beginning to attract a more diversified industrial base including health-related services, aerospace, research and technology-related industries. These are expected to bring higher paying, more professional jobs to the area. As the economy diversifies and job growth increases, it is anticipated that the demand for new housing within the region will increase. The Louisiana State Gaming Commission has recently approved the development of at least one major Casino facility in the New Orleans area, to be located in Orleans Parish. The projected cost of the facility has been down-scaled from over \$1 billion to approximately \$425 million. It has not been determined how the introduction of gaming facilities and casinos within the New Orleans area will affect population and housing growth. It is expected to have a positive influence on employment by creating numerous tourist and service related jobs. However, these jobs are typically low paying and historically have not increased the demand for single family housing.

Employment growth projections (EXHIBIT 5) indicate that the New Orleans MSA is expected to average approximately 5,470 new jobs per year from 1992 to 1996, up from the growth of 3,100 jobs in 1991. Approximately 35% of the existing jobs are located in Jefferson Parish, which expects to derive a substantial amount of the new job growth from immigration to the New Orleans area as well as the suburban migration by some Orleans Parish and central business district companies.

ESTELLE PLANTATION PARTNERSHIP
December 7, 1992

02-4680.00

During the 1990's, the subject property will compete with executive housing projects and golf course communities in the employment areas outside the West Bank of Jefferson Parish and specifically with a growing number of communities in St. Tammany Parish, on the other side of Lake Pontchartrain from Jefferson Parish.

B. Demographic Analysis and Demand Sources

Based on the 1990 census, the New Orleans MSA has a current 1992 population of 1,239,416 persons in 457,349 households. Approximately 37% of the MSA's population lives in Jefferson Parish, representing 462,968 people within 167,738 households (See EXHIBIT 2). Forecasts indicate that for the first time since the early 1980's, the MSA will begin to experience net immigration of population, possibly during the mid to late 1990's. According to projections made by the Business and Economic Research Division of the University of New Orleans and the New Orleans River Region Chamber, household growth is expected to rebound to an average of 7,732 new households per year in the MSA from 1992 to 1996 for an annual growth rate of 1.6%.

The West Bank CMA, where the subject site is located, represents about 14% of the households in the MSA, and 15% of the projected annual household growth. The CMA is projected to grow by an annual average of 241 persons and 674 households from 1992 to 1996, including some movement from the more urban areas of Orleans Parish to the more suburban CMA with the majority of the household growth generated internally within the West Bank CMA.

The 25 to 34 age category will remain the single largest age group in the CMA through 1996, declining gradually from 17.5% of the population in 1991 to 17.4% of the population in 1996 (See EXHIBIT 3). Following national trends, much stronger growth will occur in the age group between 35 and 44. This age cohort will grow from 15.6% to 17.7% of the CMA's population, expanding by an annual average of 791 persons through 1996. These age groups, particularly when found in married couple or family households, have the highest home-ownership rates of any age group.

ESTELLE PLANTATION PARTNERSHIP
December 7, 1992

02-4680.00

The percentage of married couples with children who buy new homes has remained stable in the United States since 1980. National trends, wherein married couples with children make up 60% of all move-up buyers and about 54% of all new-home buyers, are reflected in the market profiles of New Orleans home buyers. This trend toward strong growth in persons aged 35 to 54 is positive for the development of new "move-up" and luxury single-family homes at the subject property.

Residential permit activity for both single-family and multifamily construction has declined each year since it peaked in 1983 (See EXHIBIT 7). Current figures indicate that in 1992 the area will experience a 50% increase in permit volume in the MSA and a 270% increase in volume in Jefferson Parish. As of the end of July 1992 Jefferson Parish was issuing permits at an annual rate of 1,956, an increase of 1,426 over the 1991 total of 530 permits issued. Affecting the dramatic increase in permit activity are lowered interest rates for new construction and permanent mortgages, the beginnings of a return of speculative building and the anticipated end of the recession.

Summary

The outlook for residential construction activity is brighter than it has been during the mid-1980's to early 1990's. This is based on the assumptions that (1) mortgage rates continue to stay below 10% and especially if they remain at current levels (below 8%), and (2) inventory levels continue to be depleted, (3) the job market strengthens, and (4) consumer confidence returns, then increasing housing sales price appreciation and construction activity can be expected. In summary, the long-term outlook for the New Orleans economy and specifically Jefferson Parish is positive once the market fully recovers from the national recession. Job growth, however, will remain moderate as the employment base converts away from petroleum-based industries. Increases in employment and population are expected to contribute to gains in personal income in the 1990's, which could have a favorable impact on demand for "move-up" housing.

ESTELLE PLANTATION PARTNERSHIP
December 7, 1992

02-4680.00

IV. COMPETITIVE MARKET AREA

In order to determine the potential for the development of single family lots and homes at the proposed site, competitive projects within the market were surveyed. Among the projects selected were competitive planned unit developments with golf courses and single family subdivisions having competitive price and product types. A total of 12 actively selling and re-sale communities were identified with a total of 7,520 units planned, 6,606 (88%) of which have been offered for sale to date. Of the homes offered, 6,057 (92%) have been sold. Home pricing and sales data for each of the surveyed projects is shown on EXHIBITS 9-A and 9-B, with lot characteristics of each project summarized on EXHIBIT 9-A. The map on EXHIBIT 8 plots the location of each project in relation to the subject site.

Many of the projects surveyed have already sold out of developer offered lots and units and are currently selling resale lots owned by individuals, builders or investors. Home prices among the projects range from \$49,000 (a 900 s.f. condominium) to over \$1 million for a 10,000 s.f. mansion. The majority of the homes surveyed are priced in the \$150,000 to \$300,000 price category. Lot prices at the communities range from \$21,000 to \$305,000 for lots from 9,600 square feet to over an acre in size. Average lot sizes are just under a third of an acre, with the majority of the lots priced between \$35,000 and \$60,000. While the majority of the lots are sold to builders who resell to individuals for custom homes, some of the properties sell directly to individuals for investment or use. Stonebridge offers below market financing to individuals at the prime rate less 1.5%, which has increased recent lot absorption. Several of the projects located in Metairie near the Metairie and New Orleans Country Clubs have in-fill lots for sale by individual owners. These locations are also prime for "teardown" lot development opportunities.

Projects surveyed are sorted by average home price in EXHIBITS 9-A and 9-B. As the table shows, homes sales absorption ranges from approximately 1.6 to 9.1 units per project per month depending upon the price range. The strongest sales have historically taken place within the communities that offer homes priced below \$250,000. The rate of absorption in projects with product over \$250,000 is notably slower than among the more

ESTELLE PLANTATION PARTNERSHIP
December 7, 1992

02-4680.00

competitively priced projects. Actual build-out of homes on premium lots (with completion clauses in the sales contracts) in some of these communities is slowed by individuals and builders who wait until close to the deadline for beginning construction. As the available lots and homes in the more preferred areas in St. Tammany and the East Bank begin to sell out, demand should increase as the West Bank emerges as an increasingly attractive alternative for lots with amenity orientations (e.g. near or facing a golf course). However, the current slow pace of sales of the more expensive product on the West Bank should continue until competition from projects in more preferred areas decreases further and the economy begins to pull out of the recession, creating greater internal demand for the projects from move up home buyers currently living on the West Bank.

The two most competitive golf communities include:

1. Stonebridge: A moderately priced private golf and 1,008-lot community currently being developed by Marrero Land, located in the West Bank area. A bank owned the project in 1989 and 1990 and sold off 50 to 60 of the lots per year at discounted prices of \$20,000 to \$60,000. A total of 21 lots were sold in 1991 at prices of \$30,000 to \$70,000. Marrero Land Company purchased the remaining developed lots from the bank and is currently selling them to builders and individuals without direct discounting to the public. Builders receive a 10% discount but must build within 18 months and individuals are offered special financing terms and must build within 5 years.
2. Eastover: A security gated and public golf and residential community with a total of 650 lots priced from \$35,000 to \$60,000 for interior lots and \$65,000 to \$75,000 for golf lots. Since the project began in September 1987, a total of 134 lots have been sold to builders and consumers at an average rate of 30 lots per year. The concept of a gated community with a public golf facility has received mixed reviews, therefore we recommended lots prices lower than Eastover's. Currently they are selling lots to builders at discounted prices but refused to disclose the average discount offered (the market rate is typically a 10% discount to builders with a completion clause for the commencement of building homes on the lots).

ESTELLE PLANTATION PARTNERSHIP
December 7, 1992

02-4680.00

While these communities represent golf-oriented consumer alternatives in the market, only Eastover has a similar calibre of golf course as that proposed for the subject site. Stonebridge and Eastover were able to command a 20-30% premium on their golf oriented lots. Before the builder discount the home to lot ratios (i.e. amount the lot accounts for of the finished "house-lot" package) were approximately 20% on the non-amenity lots and 25% on the golf oriented lots. This ratio fell to 18% and 23%, respectively once the discounts to the builders were considered a factor.

V. POTENTIAL DEPTH OF THE MARKET AND THE NEED FOR NEW HOUSING

A statistical demand analysis, summarized in EXHIBIT 10, was conducted to evaluate the potential depth of the market and need for single-family detached homes at the subject site. This analysis is a critical component of determining a well-balanced, market-driven development program. Lot and home prices used in this analysis were determined by and reflect both demographic conditions within the CMA and that area's historical trends in for sale housing. The mix of lot prices range from \$28,000 to a maximum of \$77,000. Home prices calculated on the basis of a lot to home ratio in the 20% to 22% range, are \$140,000 to \$320,000. The statistical analysis is consistent with historical market performance of competitive properties and future growth forecasts and trends for the MSA and the CMA.

The need for new single-family homes is generated from three primary sources:

- 1) New households - households migrating to the New Orleans MSA or new household formations;
- 2) Owner preference - households within the MSA who presently own their own home but decide to buy a new residence due to their family growing with the addition of children or other lifestyle changes (i.e. upgrade, move-up, move-over or move-down buyers);

ESTELLE PLANTATION PARTNERSHIP
December 7, 1992

02-4680.00

- 3) Renter upgrading - households within the MSA presently renting who prefer to purchase a home.

Factors creating need within the market include income, home ownership propensity and turnover (i.e. propensity to move in a given year) for the home price ranges of \$140,000 to \$340,000, corresponding with lot prices of between \$28,000 and \$79,000. These price and income ranges were selected because they represent home and lot prices at potentially competitive projects located within the New Orleans MSA.

In order to estimate each income group's propensity to purchase a new home as opposed to a resale home or other product type, an "active market factor" was applied to the qualified groups of potential buyers. This factor, applied to income and home owner qualified households, is based on an analysis of product availability by price range and percentage of new versus resale home sales by price range in the MSA.

Total annual need derived from the West Bank CMA is anticipated to be 296 households annually over the next four to five years. Sixty per cent of the CMA's total need, or 178 households each year, will be derived from existing homeowners in turnover. Renter households purchasing their first home will account for another 25%, or 73 households annually. New households moving into the MSA will account for the smallest share of new housing needs, about 15% or 45 households each year; their share could increase given improvements in the overall economy and resale market specifically.

Based on an assessment of the market and competitive alternatives, the subject site is capable of an estimated capture rate of 20% of the West Bank CMA's need for new housing (for lots priced under \$80,000 and above \$25,000). This capture rate equates to a potential for 60 lots per year. This analysis is a baseline absorption of potential by price range. Actual absorption will be affected by such factors as overall economic conditions, the resale market, home mortgage interest rates, existing inventory and competitiveness in the CMA at the time sales activity is engaged and the effectiveness of the marketing strategy employed.

ESTELLE PLANTATION PARTNERSHIP

	TOTAL	66	5.5	100%

VI. CONCLUSIONS AND RECOMMENDATIONS

A summary of recommendations for the single family product program at the subject site are outlined in EXHIBIT 11. Based on our understanding of the West Bank CMA, the findings of our survey of existing residential properties and the analysis of demographic and socioeconomic trends, we believe the site can support a lot sales program making lots available in the range of \$28,000 to \$70,000. These price points are competitive with the bulk of the available inventory in the CMA and in the range of affordability of the most likely buyer segments in this market area.

We further recommend a three-component pricing program:

ESTELLE PLANTATION PARTNERSHIP
December 7, 1992

02-4680.00

**PRODUCT PROGRAM RECOMMENDATIONS
AT SUBJECT SITE, JEFFERSON PARISH, LOUISIANA**

<u>Orientation</u>	<u>Lot Size</u>	<u>Price Range</u>	<u>% of Mix</u>
Primarily Golf	20,000 s.f.	\$50,000-\$70,000	16%
Primarily Golf	16,000 s.f.	\$52,000-\$58,000	22%
Golf/Non-Golf	13,000 s.f.	\$34,000-\$48,000	25%
Clubhouse/Golf	10,000 s.f.	\$28,000-\$39,000	37%

Our surveys of competitive residential for-sale projects with amenity orientations indicate that projects with the faster sales paces of 7.4 to 9.1 lots and homes per month include those which offer a broad price range of product and/or lower priced product in general. New home sales among projects surveyed are strongest below \$200,000 (lots priced under \$50,000). Therefore, our recommendations of lots priced from \$28,000 to \$70,000 dollars and ranging in size from 10,000 to 20,000 square feet are consistent with prices at the best selling, most competitive projects within the marketplace. We based specific recommendations for the sizes, pricing, orientation and frontage of the recommended lots, at the subject site, upon the more popular selling lots at projects we considered to be the most competitive. We recommend 23% of the developable property be devoted to 20,000 s.f. lots. In order to command the recommended prices of lots in this category, a maximum number of the 20,000 s.f. lots should have a golf orientation with a minimum frontage of 80 feet. The 13,000 and 16,000 s.f. lots should be divided into those with golf orientations and the remainder having close proximity to the lots with golf frontage (i.e. golf-view lots across the street from the golf course). The smallest lots recommended are in 10,000 s.f. range. The majority of these lots should be located near the clubhouse and the swim/tennis facility, as a higher density, high activity area. Our research indicates the majority of these lots would probably be purchased by first time "move-up" buyers with children. All three types of lots should have their own neighborhood, with both amenity and non-amenity orientations. The best locations should be reserved for the larger lots.

ESTELLE PLANTATION PARTNERSHIP
December 7, 1992

02-4680.00

The demographic analysis revealed that only about 16% of households in the New Orleans MSA can afford a new home priced in excess of \$200,000. Less than 10% can purchase a home priced at \$300,000 or above. But, as shown in EXHIBIT 4, 46% of potential owner movers could afford a new home priced between \$90,000 and \$209,000. Based on location, supply and demand, and the golf orientation we recommend single family product priced between \$130,000 and \$290,000. The lower prices will draw consumers who would like to live in a prestigious community but are currently priced out of the market. The lower priced product is also likely to attract a younger market audience profile that seems to be more accepting of the idea of living on the West Bank.

The presence of a golf course, albeit municipal, does offer some opportunity for premiums based on views. We have identified premiums for golf and clubhouse views as well as a non-golf or interior lot alternative. However, because the municipal golf course may cause some concern with regard to traffic, accessibility or security at the subdivision, certain precautions should be taken. Separate access roads leading to the subdivision and the golf course should be included in the overall design. A slight open space buffer should be included at the back of any lots that back-up to the golf course. Lots may still be sold on the basis of golf views, but without the feeling among potential purchasers that their home is too accessible or vulnerable.

Consumers in the New Orleans area, as in other parts of the country, have very definite ideas regarding the "better areas to buy a home". Local wisdom, as expressed by Realtors and other local real estate professionals, states that more prestigious addresses are the established neighborhoods of New Orleans, e.g., the East Bank neighborhood such as the Garden District, University, Old Metairie, French Quarter and State Street areas. Some resistance to the West Bank location for up-scale housing should be factored into all decisions in marketing as well as anticipated levels of absorption at the subject property. While these facts may be considered a "negative" for subdivisions attempting to sell at the very high-end of the market, it presents a "positive" opportunity to cater to the mid-price ranges of the move-up market, which seems to hold the greatest potential for new home sales in the area, and which your project is well suited to address.

1/ The MSA includes Jefferson, Orleans, St. Charles, St. John the Baptist, St. Bernard and St. Tammany Parishes.

2/ 1992 income estimates per U.S. Census 1990 census information and Urban Decision Systems.

3/ Based on 1990 census distributions owner versus renter household; Table H-8, graduated among income distributions.

4/ Based on 24-28% of gross monthly income before taxes applied toward housing, a 9.5% interest rate and 30 year term.

5/ Based on 5%-10% average down payment for incomes less than \$50,000, 15% down payment for incomes between \$50,000 and \$75,000, and 20% down payment for incomes over \$75,000.

Loas:
All lots originally sold several years ago, however, 12 lots are on the market for sale to be built on.
Originally began ten years ago, and 75 lots sold prior to 1985

Phase II:
4.4 4.5

- 1/ STD-Single-Family Detached; CJS-Cluster Homes; MF-Multifamily attached.
- 2/ Total number of homes once the development is complete.
- 3/ Total number of lots and/or speculative homes offered for sale to date to prospective buyers.
- 4/ Average monthly sales absorption over the most recent twelve month period.
- 5/ Total remaining lots and units to be sold, including future phases.
- 6/ Estimated length of time to sell-off existing inventory of lots/units offered, but unsold, based on average sales rate.
- 7/ Estimated length of time to absorb potential inventory of lots/units planned to be offered (future phases), based on sales rate.

SUMMARY OF SELECTED ACTIVE AND EXISTING RESIDENTIAL COMMUNITIES
SURVEYED IN THE NEW ORLEANS, LA METRO AREA
SORTED BY COMMUNITY

Program

MAP PROJECT KEY NAME	TYPE OF COMMUNITY/ MARKET POSITIONING	POSITIVES	NEGATIVES	COMMENTS
1 ENGLISH TURN	High-end, luxury golf and residential community.	Quality development, high finish, prestige assoc. with club and golf course, secured community	On the "wrong side of town; wrong side of the river" - West Bank	An approximate 880-acre golf and residential community developed by Nicklaus-Siem Dev., Classic Properties and USF&O. Lot prices in community have increased by 10% to 12% since the project began in 1988. Buyers include executives, doctors, and small business owners. Approximately 31% of sales resulted from referrals and 26% from Realtors.
2 STONEBRIDGE	Residential community with moderately priced golf course.	Affordable golf course and availability of play; good variety of quality, attractive custom-built homes.	Lack of security and on-site marketing; surrounding land uses; congested traffic area	Stonebridge was the site for the 1991 Homebuilders Parade of Homes. According to sales professionals representing project, success of the community is tied to the special financing, arranged for purchase of 1.5% below prime, 15 year amort with 5 year balloon which offers young couples an opportunity to purchase a lot and have five years to build. Offer discounts if build home within 3 months.
3 LAKEWOOD ESTATES	Gated, secure community next to existing golf course	Security Considered rural, exclusive project	Sold-out, although agents actively marketing lots	Project features 24-hour security with pass card, iron gates and brick wall. Some lots view golf course through the iron gates, and although not directly on the course, these lots are very popular and carry a premium price.
4 PLANTATION ESTATES	Heavily treed residential community	Project on a ridge - high land with lots of trees	No security, no on-site amenities or marketing	Well located residential community near shopping, hospital and other local employment. Not far from bridge to city. Custom builders.
5 EASTOVER	Secured residential community with a "public" golf course.	Security attractive entry	Crowded golf course retail encroaching upon residential These have hurt image of the community.	Project had the potential to be a quality golf-oriented community. However, the developer sold surrounding properties for retail development and left little buffer between residential, negatively impacted the value of the community and residential neighborhoods. In addition, while the golf course is viewed by the market as second in quality only to English Turn, the developer created a public golf course and sold memberships to non-residents, thus maximizing the golf course before selling out the project. As a result, future homeowners have little opportunity to play golf on the already crowded golf course. Members are unhappy and the club is not operated as a service-oriented club and does not benefit future development in the community.
6 BEAU CHIENE	Very family-oriented, upper-end community. Began as a active/ second-home community.	Good public schools Quality of life - recreation, low crime, open space, trees, security	Distance from New Orleans and employ- ment. Age of community	Beau Chien is a secure development which began in 1975 by the Earnest Corporation. The golf and lake-oriented community began as a retirement and second-home project and has evolved with the Mandeville area into a family-oriented community. Beau Chien offers a high quality life style for families, including an area of good public schools, recreation centers, parks, soccer, lake amenities, and in the project: 36 holes of golf, pools, lakes, 8 tennis courts in a heavily treed setting and park-like environment.

Sep-92

MAP PROJECT KEY NAME	TYPE OF COMMUNITY/ MARKET POSITIONING	POSITIVES/NEGATIVES OF PROJECT		COMMENTS
		POSITIVES	NEGATIVES	
7 GREENLEAVES	Moderately priced large-scale residential community - very popular/respected PUD. Marketing through local real estate community.	Good schools and local recreational areas/ centers.	Community does not feature amenities, such as parks and passive recreation areas. No on-site sales or community info. center	Original developer parceled off and sold sections to various developers. Greenleaves currently features 13 separate neighborhoods of homes. Initially, lots were sold to consumers in order to get sales going. Now, lots are offered to builders only. Sales are through local builders/real estate companies. According to real estate agents in the Mandeville area, homes in this project "sell very fast".
8 ORMOND COUNTRY CLUB	Very family-oriented, moderately priced community with nature preserve, trees, etc.	Good public schools Quality of life - recreation, low crime, open space, trees, value	Distance from New Orleans and employ- ment.	Ormond is a development surrounded by wetlands, a former southern plantation area. Family-oriented community with good public schools, low crime rate, parks, animals & ducks. Community will be linked to I-10 via the new I-310 connector which is scheduled to open in 1993. The connector is less than two miles east of the project and will bring better link Ormond to New Orleans, lessening the commute. Project selling value and quality of life.
9 CHATEAU ESTATES	Golf-oriented PUD with moderate to luxury priced homes	Variety of homes Project near I-10 Near Esplanade S.C. considered good area.	Older project - starts and stops. No security	Older golf course community with most homes built back in the 1970's. Homes overlooking the golf course are \$200,000 and above; most are priced between \$200,000 and \$300,000. Prices of few remaining lots have escalated to over \$100,000 with homes from \$400,000+.
10 OAKBRIDGE PARK	In-town, upper-end neighborhood.	Quality homes in an area referred to as the "preferred area" of New Orleans.	Crime and traffic congestion No security	The majority of the older homes have been partially or totally refurbished and feature hardwood floors, high ceilings, guest homes, pool behind homes, etc. Property is well-treed with mature hardwoods. The community is family-oriented with both young and older children.
11 FARNHAM PLACE	In-town, upper-end neighborhood. Stately homes and entry	Homes maintain value, high price. High image/prestigious area	Crime and traffic congestion No security	The majority of the older homes have been partially or totally refurbished and feature hardwood floors, high ceilings, guest homes, pool behind homes, etc. Some columns at entry. Brick homes. Entry into project includes divided street with large oak trees. Other projects include <i>Cadum Park</i> on <i>Mulberry Street</i> .
12 METARIE CLUB GARDENS	In-town, upper-end neighborhood near and overlooking the Metairie Country Club and golf course.	Homes maintain value, high price. High image/prestigious area, prestigious club	Crime and traffic congestion No security	This neighborhood is considered one of "The Finest" in New Orleans. Refurbished homes include central hallways, pool or Jacuzzi, guest quarters, greenhouse, etc. Interiors include marble foyer, hardwood floors, wet bar, fireplace, custom counters, ceramic tile, security, deck and/or sunroom. Yards are well landscaped with flower gardens and mature trees.

- 1/ SFD-Single-Family Detached; CLS-Cluster Homes; MF-Multifamily attached.
- 2/ Total number of homes once the development is complete.
- 3/ Estimated length of time to sell-off existing inventory of lots/homes offered, but unsold, based on average sales rate.

RE: Estelle Plantation Partnership (SE 238) EIS
Subpopulation Study

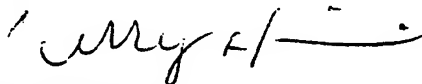

Dear Mr. Bosenberg:

Enclosed please find the final report summarizing the results of the subpopulation study. The study supports the assumption that there is a population of West Bank residents that have an allegiance to the West Bank and are not interested in moving to the Northshore. We believe the results of this study should effectively remove the Northshore from the search for alternative sites.

Please review the enclosed report at your convenience and notify Hartman Engineering, Inc. if you are in concurrence with our assessment. If you have any questions, please contact our office.

Sincerely,

HARTMAN ENGINEERING, INC.

Kerry Higgins

Subject: Estelle Plantation EIS
Subpopulation Study

Dear Mr. Carrere:

Hartman Engineering, Inc. (HEI) performed a subpopulation study to provide support for the alternatives analysis and the need for housing for the Estelle Plantation Partnership (EPP) Environmental Impact Statement (EIS). The purpose of the study was to define a subpopulation of West Bank residents that were not interested in moving to the Northshore. This subpopulation, if defined, could be utilized to justify removing the Northshore from the search for alternative sites. In addition, the subpopulation study could provide additional support for the housing demand associated with EPP's proposed golf course and housing development.

The subpopulation study consisted of a telephone survey of West Bank residents currently living in communities with golf and/or other country club amenities and/or those living in neighborhoods where the average house cost is in excess of \$100,000.00. HEI also searched historical literature and census information for trends in residential development on the West Bank. This information was to further establish the tendency of West Bank residents to remain on the West Bank. The following letter report describes the results of the subpopulation study.

TELEPHONE SURVEY

A telephone survey of residents living on the West Bank of Jefferson Parish was conducted over a two week period. The residents were surveyed from Timberlane Estates, Lake Timberlane Estates, Bent Tree, Crestwood, Barataria Estates, Plantation Estates, and Stonebridge subdivisions. The streets within the subdivisions utilized are listed in Attachment 1. Each surveyed household was asked the following four questions:

1. Are you a resident of the West Bank of Jefferson Parish?
2. How long have you resided on the West Bank of Jefferson Parish?

Hartman Engineering, Inc.

Mr. Thomas Carrere
Estelle Plantation Partnership
April 25, 1995
Page 2

3. Do you have any relatives that live on the West Bank?
4. Would you consider moving to the Northshore?

A fifth question was asked of all residents answering "yes" to question No. 4, that question was as follows:

5. If housing in the range of \$100,000 to \$200,000 were available on the West Bank with amenities such as large lot sizes, secluded location, and readily available access to golfing, fishing, boating, Jean Lafitte National Park and other recreational resources, would you still consider moving to the Northshore?

The purpose of this question was to define that portion of the West Bank population surveyed that would not move to the Northshore if a housing development with amenities such as that proposed by EPP were available. This question will not definitively establish that these people will move to Estelle, only that they would no longer consider moving to the Northshore.

Of the households phoned, 400 responded to the survey. The survey results are presented in Exhibit 1. Survey results indicate that, of the population surveyed, the residents have lived on the West Bank of Jefferson Parish for an average of 22.6 years. 71% of the same population have relatives living on the West Bank. Only 32% of the households surveyed were interested in moving to the Northshore and of that 32%, 25% would stay on the West Bank if comparable housing were available. Overall, 73% of the West Bank households indicated they prefer to live on the West Bank or would remain on the West Bank if desired housing were available. This indicates that, for the majority of West Bank residents who will purchase housing in the price range offered by EPP, the Northshore will not supply their housing needs.

Exhibit 2 consists of tables formulated from data from the Robert Charles Lessor and Company, October 17, 1994 housing study. The tables indicate the number of West Bank CMA households in the appropriate affordability range for EPP. Data exists for 1990 and 1994; the data for 1999 is anticipated due to current development trends. In 1994, approximately 23,815 households maintained an annual income ranging from \$35,000 to \$99,000. These are the existing households the EPP development will attract. The subpopulation survey represents approximately 2.5% of the total number of households (presented in the table) within the income range for EPP. The number of households within the \$35,000 to \$99,000 income range is anticipated to increase to 29,094 in 1999. The subpopulation study indicates that at a minimum, "move up" and rental buyers for the EPP project would be drawn from 17,384 households in 1994 and approximately 21,238 in 1999.

Hartman Engineering, Inc.

Mr. Thomas Carrere
Estelle Plantation Partnership
April 25, 1995
Page 3

According to the housing study, the total estimated potential demand for housing within the income range defined for EPP for the period of 1994 to 1999 is 350 new units per year (Exhibit 3). Of this demand, 185 households are anticipated to be due to "move up" buyers or renters purchasing their first home. The housing study indicated that Estelle will capture as much as 20% of the West Bank CMA's need for new housing or 20% of the 350 total and 20% of the 185 "move up" and rental buyers. The subpopulation study provides support for the premise that the 185 housing unit annual demand from "move up" and rental buyers may be greater and EPP's capture of this market may be greater than anticipated due to the majority of potential buyers desiring to remain on the West Bank.

HISTORICAL LITERATURE AND CENSUS INFORMATION

HEI reviewed historical census data and attempted to locate historical literature related to the West Bank and its development to support the supposition that West Bank residents have an "allegiance" to the West Bank. Local historians were contacted and a literature review was conducted at the University of New Orleans Library to locate historical data. Through this effort it was determined that historical literature on population growth and movement on the West Bank of Jefferson Parish was largely unavailable, with the exception of census data.

The 1990 Census Review of Jefferson Parish separates the west bank into two separate regions. The first region is the West Bank of Jefferson, and the second is the Barataria region. According to the Regional Planning Commission of New Orleans, the total Jefferson Parish Westbank population is 187,604 persons, 36% of the population of Jefferson Parish. It consists of 91,158 males and 96,445 females. Most of the population range from 25 to 44 years old (34%); 31% of the population is under 18 years; and only 7.5% are over 65 years. The West Bank is comprised of twelve communities, which include Avondale, Barataria, Bridge City, Estelle, Gretna, Harvey, Jean Lafitte, Marrero, Terrytown, Timberlane, Waggaman, and Westwego. The population change for the West Bank Jefferson region was (-4,060), while the total population change for Jefferson Parish was (-6,286) between the 1980 and 1990 Census. Between the years of 1980 and 1990, the following communities experienced a net loss of population: Avondale, Gretna, Harvey, Westwego. Of these four communities, Harvey and Avondale gained approximately 14% and 4% additional housing units, respectively, during this same period time.

Seven of the eight remaining communities gained in both population and housing during the period between 1980 and 1990. Although Terrytown and Marrero experienced population increases of only 1%, other communities such as Estelle and Jean Lafitte experienced population growths of 11% and 57%, respectively. Barataria, Timberlane and Waggaman had population increases of 3% to 9%. All of these communities experienced high levels of new housing starts. The average housing increase for these areas during the last decade was 32%, ranging from a 13% increase in Marrero to 88% for Jean Lafitte.

Hartman Engineering, Inc.

Mr. Thomas Carrere
Estelle Plantation Partnership
April 25, 1995
Page 4

Bridge City, the last remaining West Bank community can not be analyzed for the 1980 to 1990 time period because was not census designated place in 1988.

This census data reveals that, although the West Bank of Jefferson Parish experienced a decrease in population growth for the 1980 to 1990 time frame, many communities on the West Bank had both population and housing increases. This is amplified by a total West Bank population increase of 1.7% between 1990 and 1994, and future projected increases. The majority of the communities gaining in population and housing are located in the vicinity of the EPP property. The EPP property is located between the communities of Estelle and Barataria/Jean Lafitte. The community of Jean Lafitte gained more individuals and housing than any other community on the West Bank. Both Estelle and Barataria gained between 20% and 30% in housing starts. These statistics indicate that successful development of the EPP site can be achieved and demand for housing in this area is high.

Overall, the data obtained from the subpopulation survey as well as the census data support the marketability of Estelle Plantation. The subpopulation study established that, 73% of households surveyed within the income range of the planned Estelle development, prefer to live on West Bank or would remain on the West Bank if desired housing were available. Thus, establishing that the Northshore housing market does not directly appeal to many residents currently living on the West Bank of Jefferson Parish. The census data indicates that communities in the vicinity of the planned EPP development are experiencing higher growth rates than the whole of Jefferson Parish. Based on this data, the Northshore housing market can not fulfill West Bank residents need or demand for housing. The data supports removing the Northshore as a location for viable alternative sites. Pending COE agreement, the Northshore will be eliminated from the search for alternative sites.

HEI appreciates this opportunity to be of assistance to EPP.

Sincerely,

HARTMAN ENGINEERING, INC.

SE (Jefferson Parish Wetlands) 238

Dear Mr. Ventola

Jefferson Parish has indicated in previous correspondences that it will operate and maintain the golf course to be constructed pursuant to the referenced permit. The Parish previously agreed to accept the property as a donation to the Parish. Accordingly, we request that the permit application be modified to indicate that Jefferson is a co-applicant.

Sincerely,

A handwritten signature in cursive script, reading "James E. Lawson, Jr.", is written over a horizontal line.

James E. Lawson, Jr.
Vice-Chairman
Councilman, District 2

JELjr:rgb

On motion of Mr. Evans, seconded by
Mr. Ward, the following resolution was offered:

RESOLUTION NO. 73599

A resolution authorizing Jefferson Parish to accept the donation of approximately 175 acres of land in Sections 82, 85, 99 and 7 in Township 14 South, Range 24 East, Ames Farms/Estelle Plantation Subdivision, from the Estelle Plantation Partnership, to be developed by the Parish as a public golf course.

BE IT RESOLVED by the Jefferson Parish Council of Jefferson Parish, Louisiana, acting as governing authority of said Parish:

SECTION 1. That the acceptance by Jefferson Parish of a donation of approximately 175 acres of land in Sections 82, 85, 99 and 7 in Township 14 South, Range 24 East, Ames Farms/Estelle Plantation Subdivision, from the Estelle Plantation Partnership, to be developed by the Parish as a public golf course is hereby authorized.

SECTION 2. That the Chairman, or in his absence, the Vice-Chairman, is hereby authorized to execute all documents necessary to give full force and effect to this resolution.

The foregoing resolution having been submitted to a vote, the vote thereon was as follows:

YEAS: 6 NAYS: None ABSENT: (1) Lawson

The resolution was declared to be adopted on this the
20th day of January, 1993.
AMG/na-October 14, 1992

THE FOREGOING IS CERTIFIED
TO BE A TRUE & CORRECT COPY

Re: Estelle Plantation
HEI Project No. 071-04-ESTE
Jefferson Parish, Louisiana

Dear Ms. Bossier:

Reference is made to your letter dated September 15, 1994, concerning the above. A review of our files indicates that there are no sites or properties either listed on or which have been determined eligible for listing on the National Register of Historic Places in the proposed project area. In addition, there are no other known cultural resources in this area. As we anticipate no impact to significant cultural resources, we have no objections to the proposed project. Should any archaeological material be uncovered during ground altering activities, however, we request that this office be notified immediately.

If we may be of further assistance, do not hesitate to contact my staff in the Divisions of Archaeology and Historic Preservation.

Sincerely,

A handwritten signature in cursive script, appearing to read "Gerri Hobdy".

Re: Alternative Sites Research Information
Estelle Plantation Partnership
Jefferson & St. Charles Parish, Louisiana

Dear Mr. Higgins:

Thank you for your letter dated May 15, 1995 concerning the above referenced subject. Please be advised that Destrehan Plantation, located in St. Charles Parish and within the boundaries of Alternative #5 for the referenced development, is listed on the National Register of Historic Places (see enclosed map). All other numbers on this map indicate a structure which is fifty years old or older.

In addition to the above, there is a recorded archaeological site, 16JE73, located within the boundaries of Alternative #3 (see enclosed map and copy of site record form). According to the information currently on file, the site has apparently been impacted by highway construction and may be destroyed. Only additional field investigations can confirm this, however.

If we can be of further assistance, please do not hesitate to contact us.

Sincerely,

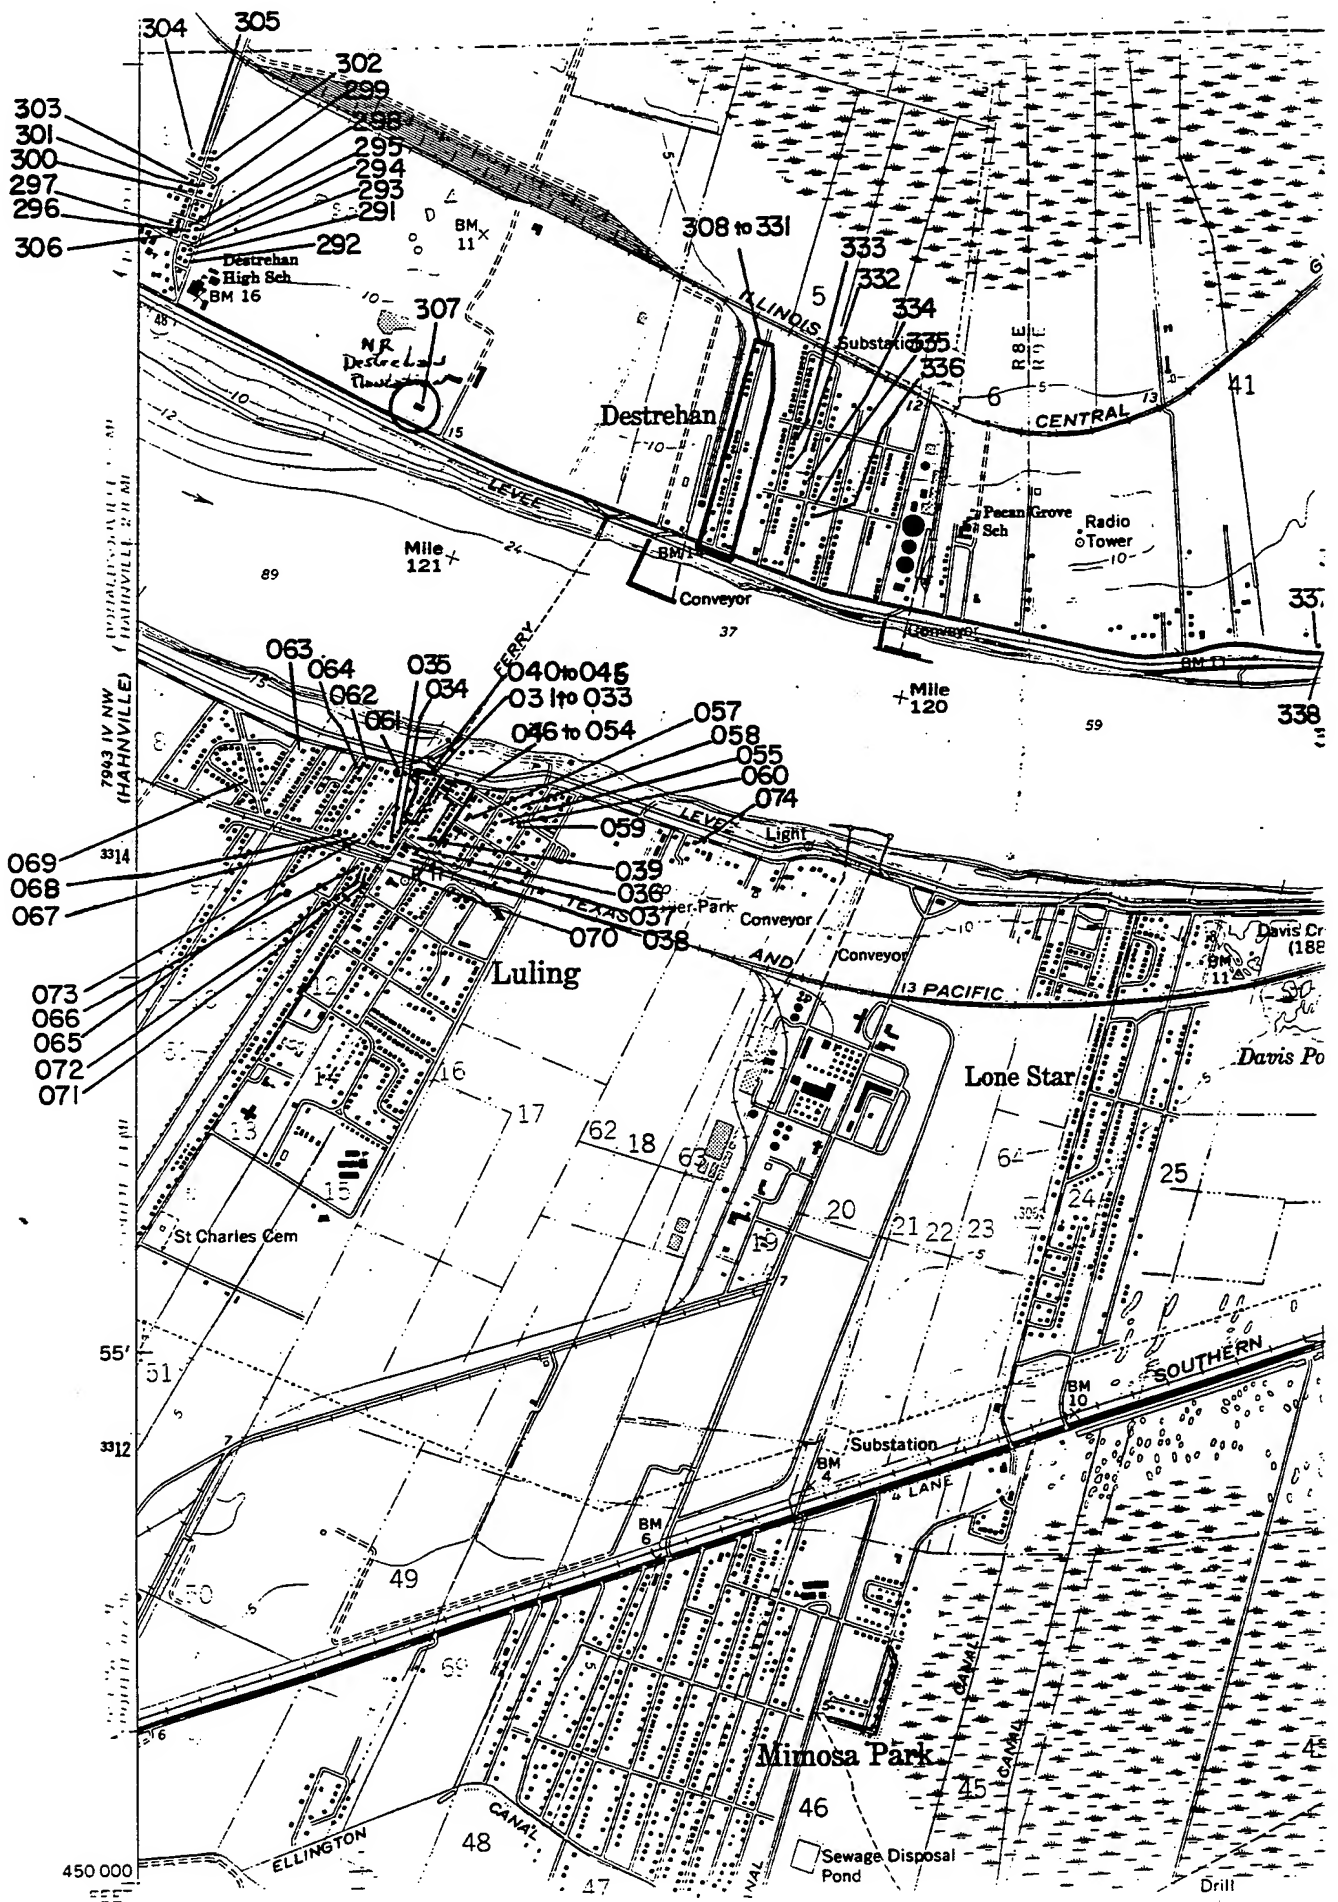

Gerri Hobdy
State Historic Preservation Officer

SITE RECORD UPDATE FORM

SITE NAME: No name

STATE SURVEY NO.: 16 JE 73

QUAD: Bertrandville, La., 7.5 min. 33-Fd

UTM COORDINATES: N 3301660, E 780400

TOWNSHIP, RANGE, SECTION: irreg. Section 1, T15S, R23E.

SITE DESCRIPTION, CONDITION, AND PRESENT AND FUTURE IMPACTS:

This small shell midden was impacted by the construction of the Lafitte - Larose highway. Its present condition is unknown, but the site was probably destroyed.

SURVEY METHODS AND DESCRIPTION OF MATERIALS COLLECTED:

Site not located; presumed destroyed.

RECOMMENDATIONS:

None. Site is apparently destroyed.

REMARKS:

Due to the vagueness of the original report, it is unclear if this is a disturbed in situ midden or only material from a spoil dump. It lies within the West Bank impact corridor zone.

New Orleans, LA 70139

Attention: Mr. Thomas A. Sands, Agent for Estelle Plantation Partnership

Dear Mr. Sands:

RE: Proposal for Estelle Plantation Partnership to place fill material for the construction of a public golf course and construction of residential and commercial uses on the area surrounding the golf course, Jefferson Parish.

This is to acknowledge that you have completed the requirements for Water Quality Certification for the above referenced proposal.

It is our opinion that your proposed project will not violate water quality standards of the State of Louisiana, therefore, we offer no objection to this project provided that the fill material used is free of contaminants, that all practicable means are utilized to minimize any discharge of water pollutants that can result from the proposed project, that a state wastewater discharge permit is obtained from this office for any discharges from the site and that the development utilizes a centralized sewage system. However, if a centralized system is not available, a state approved individual sewage treatment system may be installed.

In accordance with statutory authority contained in the Louisiana Revised Statutes of 1950, Title 30, Chapter 11, Part IV, Section 2074 A(3) and provisions of Section 401 of the Clean Water Act (P.L. 95-217), the Office of Water Resources certifies that it is reasonable to expect that water quality standards of Louisiana provided for under Section 303 of P.L. 95-217 will not be violated.

Sincerely,

J. Dale Givens, Assistant Secretary
Office of Water Resources

Re: List of wells within a five mile
radius of a specified point

Dear Ms. Bossier:

Enclosed are copies of computer printouts indicating drilling activity for the area concerned. However, we do not express any opinion as to the accuracy of these records or as to their completeness. If your inquiry is directed for purposes of a title search, we recommend that you conduct a thorough review of our files.

Should you require additional information concerning the possible participation of the subject acreage in units established by the Office of Conservation, our files are available for review in this regard as well.

Sincerely yours,

Re: R25E and T14S - S8 and 9
R24E and T14S - S2
R23E and T14S - S95
R24E and T14S - S82 and 95
R22E and T13S - S1
R22E and T12S - S1

Dear Ms. Bossier:

Our computer records do not indicate any past or present drilling activity within the above referenced area. I have enclosed copies of the computer records for the other areas of interest where some drilling activity is known. These indicate that the wells (referenced by serial number) were drilled and plugged with no production. However, we do not express any opinion as to the accuracy of these records or as to their completeness. If your inquiry is directed for purposes of a title search, we recommend that you conduct a thorough review of our files.

Should you require additional information concerning the possible participation of the subject acreage in units established by the Office of Conservation, our files are available for review in this regard as well. As discussed by telephone, due to the lack of staff and resources, this Office will be unable to answer further drilling activity inquiries from your company; however, Ethel Mae Pierce should be able to assist you with your future requests.

Sincerely yours,

Calvin C. Thomas, Director
Geological Oil and Gas Division

**EXPLANATION OF TERMS FOR THE LOUISIANA DEPT. OF TRANSPORTATION AND DEVELOPMENT'S
COMPUTERIZED LISTING OF REGISTERED WATER WELLS AND HOLES**

IDENTIFICATION NUMBER	-	This is a unique I.D. number that includes the latitude (first six numbers), longitude (second six numbers), and a sequential number (last two digits). The sequential number identifies a specific well when other nearby wells have the same latitude and longitude.
REVISED COORDINATES	-	Latitude and Longitude of a well (shown only if different than the I.D. number).
OWNER'S NAME	-	Name of an individual, company or agency who was or is either the legal owner of the property or the lessee at the time the well was inventoried or registered.
WELL NUMBER	-	Well number, by parish, assigned either by the U.S. Geological Survey or LA. DOTD.
OWNER'S NUMBER	-	Well name or number assigned by the owner to identify each well on his/her property.
GEOLOGIC UNIT	-	Aquifer in which the well is screened.
WELL DEPTH	-	Depth of the well, in feet, measured from bottom of the screen (or bottom of the tail pipe, back pressure valve, etc.) to the ground surface.
WELL USE/SUBUSE	-	Main use of the well (see attached sheet). The use of the well is subject to change and may not be up-to-date, especially for older wells.
CASING/SCREEN DIAMETER	-	Nominal diameter of casing/screen, in inches.
SCREEN INTERVAL	-	Depth, in feet, measured from ground surface to the top and bottom of the screen.
DATE COMPLETED	-	The month and year the well was completed.
AVAILABLE INFORMATION	-	Indicates available information as follows: E - Geophysical Log D - Drillers Log M - Mechanical Analysis Q - Quality of Water B - Bacteriological Analysis P - Pumping Test W - Water Level

Available information may be obtained from DOTD, USGS, driller, engineer, and/or other sources.

WETLAND VALUE ASSESSMENT HABITAT EVALUATION ANALYSIS

**HABITAT ASSESSMENT MODELS FOR
FRESH SWAMP AND BOTTOMLAND HARDWOODS
WITHIN THE LOUISIANA COASTAL ZONE**

**LOUISIANA DEPARTMENT OF NATURAL RESOURCES
BATON ROUGE, LOUISIANA**

JANUARY 10, 1994

HABITAT ASSESSMENT MODELS FOR FRESH SWAMP AND BOTTOMLAND HARDWOODS WITHIN THE LOUISIANA COASTAL ZONE

I. INTRODUCTION

The habitat assessment models presented in this document are a modification of the U.S. Fish and Wildlife Service's Habitat Evaluation Procedures (HEP) and utilize, for each habitat type, one assemblage of variables considered important for determining the suitability of an area to support a diversity of fish and wildlife species. These models are intended to complement the Wetland Value Assessment Methodology (WVAM) models for fresh, intermediate, brackish, and saline marsh and shall be used to quantify net gains and losses of ecological value associated with permitted activities and compensatory mitigation proposals in the Louisiana Coastal Zone. (The WVAM models were developed by the Environmental Work Group for the Coastal Wetlands Planning, Protection, and Restoration Act to evaluate projects proposed to be constructed pursuant to that Act.)

The models presented in this document were developed concurrently with the proposed Mitigation Regulations for the Louisiana Coastal Zone. The models were distributed for review, in draft form, on March 15, 1993, and July 17, 1993, with additional modifications distributed October 22, 1993. Reviewers of the models included representatives of state and federal agencies, environmental groups, oil and gas industry, chemical industry, real estate interests, agricultural interests, landowners, and local governments. While the proposed mitigation regulations will not go into effect until at least July 1, 1994, these models are considered applicable immediately.

Questions or comments regarding this document should be directed to Quin Kinler, Louisiana Department of Natural Resources, Office of Coastal Restoration and Management, P.O. Box 44487, Baton Rouge, LA 70804-4487, 504-342-1375.

II. CONCEPT / METHODOLOGY

The concept and methodology for use of these models are almost identical to the WVAM:

"The WVA operates under the assumption that optimal conditions for general fish and wildlife habitat within a given coastal wetland type can be characterized, and that existing or predicted conditions can be compared to that optimum to provide an index of habitat quality. Habitat quality is estimated or expressed through the use of a mathematical model developed specifically for each wetland type. Each model consists of 1) a list of variables that are considered important in characterizing fish and wildlife habitat, 2) a Suitability Index graph for each variable, which defines the assumed relationship between habitat quality (Suitability Index) and different

variable values, and 3) a mathematical formula that combines Suitability Index for each variable into a single value for wetland habitat quality; that single value is referred to as the Habitat Suitability Index, or HSI."

The WVAM models and the models for fresh swamp and bottomland hardwoods attempt to assess the suitability of each habitat type for providing resting, foraging, breeding, and nursery habitat to a diverse assemblage of fish and wildlife species. While the models do not specifically assess other wetland functions and values such as storm-surge protection, floodwater storage, water quality improvement, nutrient import/export, and aesthetics, it can be generally assumed that these functions and values are positively correlated with fish and wildlife habitat quality.

III. VARIABLE SELECTION

The selection of variables was based on review of 1) Habitat Suitability Index models, published by the U.S. Fish and Wildlife Service, for wood duck, barred owl, swamp rabbit, mink, downy woodpecker, and gray squirrel, 2) a community model for forest birds, published by the U.S. Fish and Wildlife Service, 3) "A Habitat Evaluation System for Water Resources Planning", published by the U.S. Army Corps of Engineers, and 4) a draft version of "A Community Habitat Evaluation Model for Bottomland Hardwood Forests in the Southeastern United States", coauthored by the U.S. Army Corps of Engineers and the U.S. Fish and Wildlife Service.

Several habitat variables appeared repeatedly in the various models reviewed. In general, it was concluded that those habitat variables which occurred most frequently in the various models were the most important for assessing habitat quality. The species-specific models concentrate on assessment of site-specific habitat quality features such as tree species composition, forest stand structure (understory, midstory, overstory conditions), stand maturity, and hydrology. The other models rely heavily on how a site fits into the overall "landscape". Both approaches are important and warrant consideration. The models presented in this document attempt to incorporate both approaches.

IV. SUITABILITY INDEX GRAPHS

The concept of suitability index graphs for the subject models is identical to that for the WVAM models:

"A Suitability Index (SI) graph is a graphical representation of how fish and wildlife habitat quality or 'suitability' of a given wetland type is predicted to change as values of the given variable change, and allows the model user to describe, through a Suitability Index, the habitat quality of a wetland area for any variable value."

In theory, each Suitability Index should range from 0.0 to 1.0, with 1.0 representing the optimal condition for the variable in question. However, because the mathematical formula that combines Suitability Indices into a single HSI involves multiplication of all Suitability Indices, a 0.0 for any Suitability Index would produce 0.0 for the HSI in the models. Therefore, in practice the lowest possible Suitability Index for these draft models is 0.01.

The suitability index graphs are presented in Appendices A (fresh swamp) and B (bottomland hardwoods).

V. SUITABILITY INDEX GRAPH ASSUMPTIONS

A. Fresh Swamp Model

Fresh swamp is defined as an area supporting or capable of supporting a canopy of woody vegetation which covers at least 33 percent of the area's surface, and with at least 60 percent of that canopy consisting of any combination of baldcypress, tupelogum, red maple, buttonbush, and/or planertree. (See Appendix C for scientific names.) If woody vegetation is present but the canopy covers less than 33 percent of the area, the fresh marsh WVAM model should be applied. If greater than 40 percent of the woody vegetation canopy consists of other tree species such as oaks, hickories, American elm, cedar elm, green ash, sweetgum, sugarberry, boxelder, common persimmon, honeylocust, red mulberry, eastern cottonwood, black willow, American sycamore, etc., the bottomland hardwood model should be applied.

Variable V1 - Stand Structure

Fresh swamp tree species do not produce hard mast; consequently, wildlife foods predominantly consist of soft mast, other edible seeds, invertebrates, and vegetation. Because most swamp tree species produce some soft mast or other edible seeds, the actual tree species composition is not usually a limiting factor. More limiting is the presence of stand structure to provide resting, foraging, breeding, nesting, and nursery habitat and the medium for invertebrate production. This medium can exist as herbaceous vegetation, shrub-scrub/midstory cover, or overstory canopy and preferably as a combination of all three. This variable assigns the lowest suitability to sites with a limited amount of all three stand structure components, the highest suitability to sites with a significant amount of all three stand structure components, and mid-range suitability to various combinations when one or two stand structure components are present.

Variable V2 - Stand Maturity

Because of man's historical conversion of fresh swamp, the loss of fresh swamp to saltwater intrusion, historical and ongoing

timber harvesting within fresh swamp, and slow tree growth rate in the subsiding Coastal Zone, fresh swamps with mature sizeable trees are a unique but ecologically important feature. These older (mature) trees provide important wildlife requisites such as tree snags and nesting cavities and the medium for invertebrate (wildlife food) production. Additionally, as the stronger trees establish themselves in the canopy, weaker trees are out-competed and eventually die, forming additional snags and downed treetops that would not be present in younger stands. The suitability graph for this variable assumes that snags, cavities, downed treetops, and invertebrate production are present in suitable amounts beginning at about age 50. Therefore, stands with a canopy of trees with an average age of 50 years or greater are considered optimal for this variable (SI = 1.0). Below age 50, it is assumed that the above-mentioned wildlife requisites become more available with increasing age. When the average age of canopy-dominant and canopy-codominant trees is unknown, average tree diameter at breast height (dbh) can be used to determine the Suitability Index for this variable.

Variable V3 - Hydrology

The primary assumption for this variable is that a natural water regime producing temporarily flooded, seasonally flooded, or semi-permanently flooded conditions is optimal. Such a water regime in fresh swamp produces ground vegetation (food, cover, detritus), crawfish, and other invertebrates; provides fish spawning and nursery habitat; and maintains water quality for fish and wildlife (SI = 1.0).

Permanently flooded fresh swamp with consistent riverine input or other water exchange provides optimal fish spawning and nursery habitat but moderate value wildlife habitat; considering both fish and wildlife components, a composite SI of 0.8 was selected for this situation.

Permanently flooded fresh swamp with little water exchange can produce poor quality water during warm weather, periodically reducing fish use and crawfish production; however, that same water can weaken certain trees producing snags, downed treetops, and invertebrates; with all factors considered, permanent flooded swamp with little water exchange is assumed to have moderate (SI = 0.4) habitat value.

Also assumed to have moderate value is a fresh swamp which is part of drainage system that allows water to remain on the site for irregular periods of time; in this situation the vegetative component of the swamp would be optimal, providing excellent habitat for many wildlife species; however, species which are heavily dependent on water would have only temporary access and fish are would generally be excluded.

In an efficient forced drainage system, the vegetative component provides some habitat value, but wildlife species which

are dependent on water and fish would essentially be excluded year round (SI = 0.1).

Variable V4 - Size of Contiguous Forested Area

Although edge and diversity, which are dominant features of small forested tracts, are important for certain wildlife species, it is important to understand four concepts: 1) species which thrive in edge habitat are highly mobile and presently occur in substantial numbers, 2) because of forest fragmentation and ongoing timber harvesting by man, edge and diversity are quite available, 3) most species found in "edge" habitat are "generalists" in habitat use and are quite capable of existing in larger tracts, and 4) those species in greatest need of conservation are "specialists" in habitat use and require large forested tracts. Therefore, the basic assumption for this variable is that larger forested tracts are less common and offer higher quality habitat than smaller tracts. For this model, tracts greater than 500 acres in size are considered large enough to warrant being considered optimal.

Variable V5 - Suitability and Traversability of Surrounding Land Uses

Many wildlife species commonly associated with fresh swamp will often use adjacent areas as temporary escape or resting cover and seasonal or diurnal food sources. Surrounding land uses which meet specific needs can render a given area of swamp more valuable to a cadre of wildlife species. Additionally, the type of surrounding land use may encourage, allow, or discourage wildlife movement between two or more desirable habitats. Land uses which allow such movement essentially increase the amount of habitat available to wildlife populations. The weighting factor assigned to various land uses reflects their estimated potential to meet specific needs and allow movement between more desirable habitats.

Variable V6 - Disturbance

Human-induced disturbance can displace individuals, modify home ranges, interfere with reproduction, cause stress, and force animals to use important energy reserves. The effect of disturbance is a factor of the distance to disturbance and the type of disturbance. A separate Suitability Graph was developed for each of those factors and the results are combined to yield a single Suitability Index for Disturbance. If the source of disturbance is located beyond 500 feet from the perimeter of the site or if the type of disturbance is "insignificant", the effects of disturbance are assumed to be negligible and SI = 1.0. If the source of disturbance is located within 50 feet of the perimeter of the site and the disturbance is "Constant or Major", the effects of disturbance are assumed to be maximum and SI = 0.01. Other combinations of distance to, and type of, disturbance yield moderate SI's of 0.26, 0.41, 0.5, and 0.65.

B. Bottomland Hardwoods Model.

Bottomland hardwoods are defined as an area supporting or capable of supporting a canopy of woody vegetation of which greater than 40 percent consists of tree species such as oaks, hickories, American elm, cedar elm, green ash, sweetgum, sugarberry, boxelder, common persimmon, honeylocust, red mulberry, eastern cottonwood, black willow, American sycamore, etc. (If 60 percent of the woody canopy consists of any combination of baldcypress, tupelogum, red maple, buttonbush, and/or planertree, the fresh swamp model should be applied).

Variable V1 - Tree Species Composition

Wildlife which utilize bottomland hardwoods depend heavily on mast, other edible seeds, and tree buds as primary sources of food. The basic assumptions for this variable are: 1) more production of mast (hard and/or soft) and other edible seeds is better than less production, and 2) because of its availability during late fall and winter and its high energy content, hard mast is more critical than soft mast, other edible seeds, and buds.

Variable V2 - Stand Maturity

Prior to about Age 10, bottomland hardwood tree species provide only a very limited amount of wildlife food, in the form of buds and leaves. Accordingly, the SI for those early years shows a very small increase from 0.0 for a site with no trees to 0.1 for a site with 10-year-old trees. The production of soft mast and other edible seeds is expected to begin at about Age 10, increase with age, and reach maximum potential by approximately Age 50 (SI = 1.0). In general, hard mast production is expected to begin at about Age 20 (SI = 0.3), increase substantially by age 30 (SI = 0.6), and reach maximum potential by approximately Age 50.

In addition to increased production of hard mast, soft mast, other edible seeds, and buds, or in stands without mast producing trees, older stands provide important wildlife requisites such as tree snags, nesting cavities, and the medium for invertebrate (wildlife food) production. Also, as the stronger trees establish themselves in the canopy, weaker trees are out-competed and eventually die, forming additional snags and downed treetops that would not be present in younger stands. Another factor to be considered is the rarity (and associated ecological importance) of mature stands, due to man's historical conversion of bottomland hardwoods and historical and ongoing timber harvesting. When the average age of canopy-dominant and canopy-codominant trees is unknown, average tree diameter at breast height (dbh) can be used to determine the Suitability Index for this variable.

Variable V3 - Understory / Midstory

The understory and midstory components of bottomland hardwoods provide resting, foraging, breeding, nesting, and nursery habitat. The understory and midstory provide soft mast, other edible seeds, and vegetation as sources of food. The understory and midstory also provide the medium for invertebrate production, an additional food source. The amount of understory coverage and the amount of midstory coverage are considered equally important and are given equal weight in determining the Suitability Index for this variable.

Variable V4 - Hydrology

Bottomland hardwood stands in the Louisiana Coastal Zone generally occur in one of four basic hydrology classes or water regimes: 1) efficient forced drainage system, 2) irregular periods of inundation due to an artificially lowered water table, 3) extended inundation or impoundment because of artificially raised water table, and 4) essentially unaltered. The optimum bottomland hardwood hydrology (SI = 1.0) is one that is essentially unaltered, allowing natural wetting and drying cycles which are beneficial to vegetation and associated fish and wildlife species. When a bottomland hardwood stand is part of an efficient forced drainage system, the vegetative component provides some habitat value, but wildlife species which are dependent on water would essentially be excluded year round, and the area would not in any way serve to promote fish production (SI = 0.1). With a moderately lowered water table, the vegetative component of the site could provide excellent habitat for many wildlife species and temporary habitat for wildlife species which are dependent on water, but fish would generally be excluded (SI = 0.5). With a raised water table, fish habitat and habitat for water-dependent wildlife could be equivalent to an unaltered system; however, other wildlife species could be adversely affected because of water-related impacts to the vegetative components of the stand (SI = 0.5).

Variable V5 - Size of Contiguous Forested Area

Although edge and diversity, which are dominant features of small forested tracts, are important for certain wildlife species, it is important to understand four concepts: 1) species which thrive in edge habitat are highly mobile and presently occur in substantial numbers, 2) because of forest fragmentation and ongoing timber harvesting by man, edge and diversity are quite available, 3) most species found in "edge" habitat are "generalists" in habitat use and are quite capable of existing in larger tracts, and 4) those species in greatest need of conservation are "specialists" in habitat use and require large forested tracts. Therefore, the basic assumption for this variable is that larger forested tracts are less common and offer higher quality habitat than smaller tracts. For this model, tracts greater than 500 acres in size are considered large enough to warrant being considered optimal.

Variable V6 - Suitability and Traversability of Surrounding Land Uses

Many wildlife species commonly associated with bottomland hardwoods will often use adjacent areas as temporary escape or resting cover and seasonal or diurnal food sources. Surrounding land uses which meet specific needs can render a given area of bottomland hardwoods more valuable to a cadre of wildlife species. Additionally, the type of surrounding land use may encourage, allow, or discourage wildlife movement between two or more desirable habitats. Land uses which allow such movement essentially increase the amount of habitat available to wildlife populations. The weighting factor assigned to various land uses reflects their estimated potential to meet specific needs and allow movement between more desirable habitats.

Variable V7 - Disturbance

Human-induced disturbance can displace individuals, modify home ranges, interfere with reproduction, cause stress, and force animals to use important energy reserves. The effect of disturbance is a factor of the distance to disturbance and the type of disturbance. A separate Suitability Graph was developed for each of those factors and the results are combined to yield a single Suitability Index for Disturbance. If the source of disturbance is located beyond 500 feet from the perimeter of the site or if the type of disturbance is "insignificant", the effects of disturbance are assumed to be negligible and $SI = 1.0$. If the source of disturbance is located within 50 feet of the perimeter of the site and the disturbance is "Constant or Major", the effects of disturbance are assumed to be maximum and $SI = 0.01$. Other combinations of distance to, and type of, disturbance yield moderate SI's of 0.26, 0.41, 0.5, and 0.65.

VI. HABITAT SUITABILITY INDEX FORMULAS

As with the WVAM, the final step in developing the subject models was "to construct a mathematical formula that combines all Suitability Indices for each wetland type into a single Habitat Suitability Index (HSI) value. Because the Suitability Indices range in value from 0.01 to 1.0, the HSI also ranges from 0.01 to 1.0, and is a numerical representation of overall or 'composite' habitat quality of the particular wetland study area being evaluated."

Any variable's Suitability Index can be weighted, by raising its exponent, to increase the importance of that variable relative to the other variables in the HSI formula. A larger exponent will increase the influence of that variable on the resultant HSI. As discussed above, the draft models attempt to incorporate site-specific habitat quality features (tree species composition, forest stand structure, stand maturity, and hydrology) and "landscape" parameters (forest size, surrounding habitat, and disturbance).

Because the primary application of these models is to quantify the loss of ecological values due to small and site-specific activities, the site specific variables (V1, V2, and V3 for fresh swamp and V1, V2, V3, and V4 for bottomland hardwoods) are considered more important and have been "given more weight" than the "landscape" variables.

For fresh swamp, the site specific variables V1 (Stand Structure) and V2 (Stand Maturity) are considered to be of greatest importance; they are weighted to the power of four. Variable V3 (Hydrology) is weighted to the power of two. The "landscape" variables (V4, V5, and V6) are not weighted.

For bottomland hardwoods, the site specific variables V1 (Tree Species Composition) and V2 (Stand Maturity) are considered to be of greatest importance; they are weighted to the power of four. Variables V3 (Understory / Midstory) and V4 (Hydrology) are weighted to the power of two. The "landscape" variables (V5, V6, and V7) are not weighted. In some cases, data for Variable V3 (Understory / Midstory) may not be readily available; in those instances that variable can be deleted from the HSI formula as indicated below.

For both fresh swamp and bottomland hardwoods, stands less than 7 years of age generally do not 1) exhibit distinguishable understory, midstory, and overstory components, 2) produce substantial mast, or 3) function as part of a forested landscape; hence, the variables Stand Structure, Tree Species Composition, Size of Contiguous Forest, and Understory / Midstory are not incorporated into the HSI formulas until the stand reaches 7 years of age.

The HSI formulas fresh swamp are:

1. If Age < 7 (or if cypress dbh < 5 and tupelogum et al. dbh < 4), then:

$$HSI = (SI_{V2}^4 \times SI_{V3}^2 \times SI_{V5} \times SI_{V6})^{1/8}, \text{ or}$$

2. If Age > 7 (or if cypress dbh > 5 or tupelogum et al. dbh > 4), then:

$$HSI = (SI_{V1}^4 \times SI_{V2}^4 \times SI_{V3}^2 \times SI_{V4} \times SI_{V5} \times SI_{V6})^{1/13}.$$

The HSI formulas bottomland hardwoods are:

1. If Age < 7 (or dbh < 5), then:

$$HSI = (SI_{V2}^4 \times SI_{V4}^2 \times SI_{V6} \times SI_{V7})^{1/3}, \text{ or}$$

2. If Age > 7 (or dbh > 5) and V3 (Understory / Midstory) data is available, then:

$$HSI = (SI_{V1}^4 \times SI_{V2}^4 \times SI_{V3}^2 \times SI_{V4}^2 \times SI_{V5} \times SI_{V6} \times SI_{V7})^{1/15}, \text{ or}$$

3. If Age > 7 (or dbh > 5) and V3 (Understory / Midstory) data is not available, then:

$$HSI = (SI_{V1}^4 \times SI_{V2}^4 \times SI_{V4}^2 \times SI_{V5} \times SI_{V6} \times SI_{V7})^{1/13}.$$

FRESH SWAMP

VARIABLE V1 - Stand Structure

Each component of stand structure should be viewed independently to determine the percent closure or coverage.

	Overstory Closure		Herbaceous Cover		Scrub-shrub/ Midstory Cover
Class 1.	33% < 50%	and	< 33%	and	< 33%
Class 2.	> 50%	and	< 33%	and	< 33%
Class 3.	33% < 50%	and	> 33%	or	> 33%
Class 4.	> 50%	and	> 33%	or	> 33%
Class 5.	33% < 50%	and	> 33%	and	> 33%
Class 6.	> 50%	and	> 33%	and	> 33%

VARIABLE V2 - Stand Maturity [i.e., average age of canopy-dominant and canopy-codominant trees]

Notes:

1. When the average age of canopy-dominant and canopy-codominant trees is unknown, average tree diameter at breast height (dbh) can be used to determine the Suitability Index for this variable].
2. Canopy-dominant and canopy co-dominant trees are those trees whose crown rises above or is an integral part of the stand's overstory. When both baldcypress and tupelogram (and other species) are present in the overstory, the average age should be weighted according to the percent canopy coverage for each species group.
3. For trees with buttress swell, dbh is the diameter measured at 12" above the swell. In baldcypress and tupelogram, this can sometimes be as high as 10 - 12 feet above the ground.

Suitability Graph

Suitability Index Line Formulas, when age is known:

If age = 0 then SI = 0.
 If $0 < \text{age} \leq 3$ then $\text{SI} = .0033 * \text{age}$
 If $3 < \text{age} \leq 7$ then $\text{SI} = (.01 * \text{age}) - .02$
 If $7 < \text{age} \leq 10$ then $\text{SI} = (.017 * \text{age}) - .07$
 If $10 < \text{age} \leq 20$ then $\text{SI} = (.02 * \text{age}) - .1$
 If $20 < \text{age} \leq 30$ then $\text{SI} = (.03 * \text{age}) - .3$
 If $30 < \text{age} \leq 50$ then $\text{SI} = .02 * \text{age}$
 If age > 50 then SI = 1.0.

Suitability Graph

Suitability Index Line Formulas for baldcypress, when age is unknown:

If dbh = 0 then SI = 0
 If $0 < \text{dbh} \leq 1$ then $\text{SI} = .01 * \text{dbh}$
 If $1 < \text{dbh} \leq 4$ then $\text{SI} = (.013 * \text{dbh}) - .002$
 If $4 < \text{dbh} \leq 7$ then $\text{SI} = (.017 * \text{dbh}) - .019$
 If $7 < \text{dbh} \leq 9$ then $\text{SI} = (.1 * \text{dbh}) - .6$
 If $9 < \text{dbh} \leq 11$ then $\text{SI} = (.15 * \text{dbh}) - 1.05$
 If $11 < \text{dbh} \leq 13$ then $\text{SI} = (.1 * \text{dbh}) - .5$
 If $13 < \text{dbh} \leq 16$ then $\text{SI} = (.067 * \text{dbh}) - .071$
 If dbh > 16 then SI = 1.0.

Suitability Graph

Suitability Index Line Formulas for tupelogram et. al., when age is unknown:

If dbh = 0 then SI = 0
 If $0 < \text{dbh} \leq 1$ then $\text{SI} = .01 * \text{dbh}$
 If $1 < \text{dbh} \leq 2$ then $\text{SI} = (.04 * \text{dbh}) - .03$
 If $2 < \text{dbh} \leq 4$ then $\text{SI} = .025 * \text{dbh}$
 If $4 < \text{dbh} \leq 6$ then $\text{SI} = (.1 * \text{dbh}) - .3$
 If $6 < \text{dbh} \leq 8$ then $\text{SI} = (.15 * \text{dbh}) - .6$
 If $8 < \text{dbh} \leq 12$ then $\text{SI} = (.1 * \text{dbh}) - .2$
 If dbh > 12 then SI = 1.0.

FRESH SWAMP

VARIABLE V3 - Hydrology

- Class 1. Forced drainage system which efficiently removes water from the surface year round.
- Class 2. Permanently flooded with little or no water exchange (stagnant, impounded); OR part of forced drainage or gravity drainage system which, because of subsidence or based on current operation, allows water to remain on-site for irregular but not extended periods of time.
- Class 3. Permanently flooded, but receives consistent riverine input and/or other water exchange.
- Class 4. Hydrology essentially unaltered and the natural water regime produces temporarily flooded, seasonally flooded, or semi-permanently flooded conditions. (The area could contain small levees and/or canals, provided that the water regime has not been significantly altered).

FRESH SWAMP

VARIABLE V4 - Size of Contiguous Forested Area

Note: Corridors less than 75 feet wide do not constitute a break in the forested area contiguity.

- Class 1. 0 to 5 acres.
- Class 2. 5.1 to 20 acres.
- Class 3. 20.1 to 100 acres.
- Class 4. 100.1 to 500 acres.
- Class 5. > 500 acres.

FRESH SWAMP

VARIABLE V5 - Suitability and Traversability of Surrounding Land Uses

Within a 0.5 mile of the perimeter of the site, determine the percent of the surrounding area that is occupied by each of the following land uses (must account for 100 percent of the area). Multiply the percentage of each land use by the suitability weighting factor shown below, add the adjusted percentages and divide by 100 for a suitability index for this variable, except that if 100% of the surrounding habitat is considered nonhabitat, SI equals 0.01.

LAND USE	Weighting factor		% of 0.5 mi. circle	Weighted Percent
Bottomland hardwood, other forested areas, marsh habitat, etc.	1.0	X	_____	= _____
Abandoned agriculture, overgrown fields, dense cover, etc.	0.6	X	_____	= _____
Pasture, hayfields, etc.	0.4	X	_____	= _____
Active agriculture.	0.2	X	_____	= _____
Nonhabitat: linear, residential, commercial, industrial development, etc.	0.0	X	_____	= _____

_____/100 = SI

VARIABLE V6 - Disturbance

The effect of disturbance is a factor of the distance to, and the type of, disturbance, hence both are incorporated in the SI formula.

Note: Linear and/or large project sites may be exposed to various types of disturbances at various distances. The SI for this variable should be weighted to account for those variances; see the example calculation of a weighted SI for Disturbance on Page A-7.

Distance Classes

- Class 1. 0 to 50 ft.
- Class 2. 50.1 to 500 ft.
- Class 3. > 500 ft.

Type Classes

Class 1. Constant / Major (Major highways, industrial, commercial, major navigation.)

Class 2. Frequent / Moderate. (Residential development, moderately used roads, waterways commonly used by small to mid-sized boats.)

Class 3. Seasonal / Intermittent. (Agriculture, aquaculture.)

Class 4. Insignificant. (Lightly Used roads and waterways, individual homes, levees, rights of way.)

SI Formula: (Distance SI + Type SI) / 2, except that if Distance > 500 feet (Class 3) or Type is Insignificant (Class 4), HSI = 1.0.

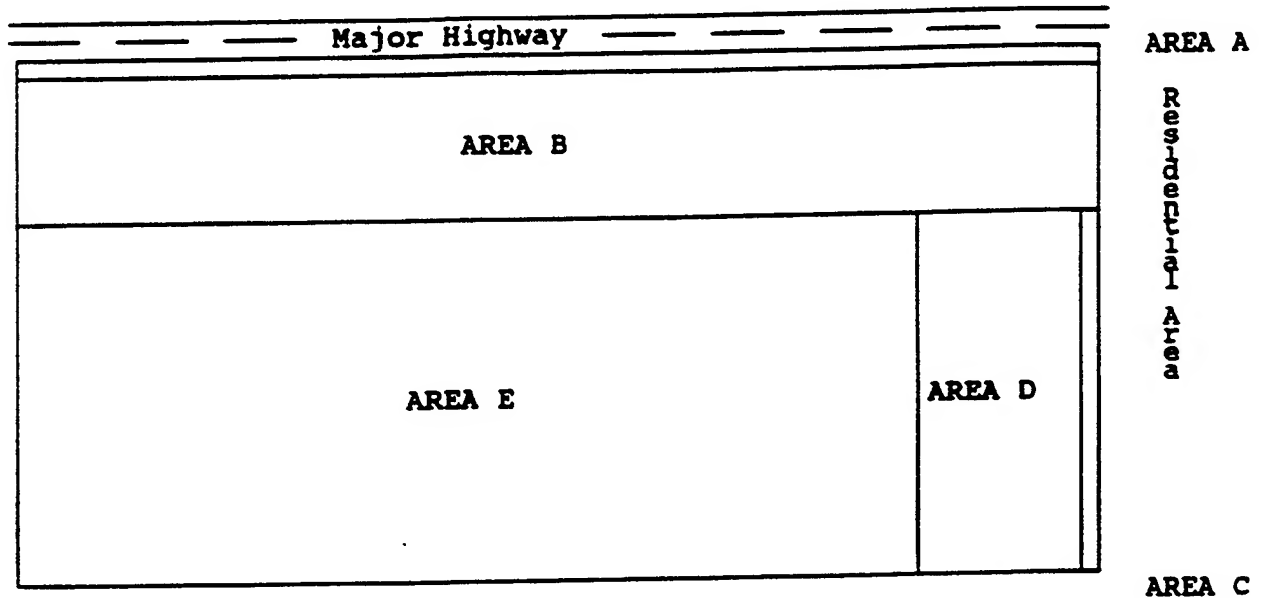

Type Class

	1	2	3	4
Distance Class 1	.01	.26	.41	1
Distance Class 2	.26	.50	.65	1
Distance Class 3	(1)	(1)	1	1

A - 1+1
 B - 2+1 = 1+2
 C - 2+2
 D - 1+3
 E - 1+2
 F - 3+1, 3+2, 3+3, 3+4
 1+4, 2+4, 3+4

Example Calculation of Weighted SI for Disturbance

The example project area is 1,500 feet by 3,000 feet or 103.3 acres. To calculate the weighted SI, the area is segregated to determine the percent of the project area that would be exposed to various types of disturbance at various distances. When a given portion of the project area is exposed to various type or distance classes, the type/distance combination which yields the lowest SI is utilized.

AREA	DIST- ANCE CLASS	TYPE CLASS	SI*	AREA DIMENSIONS	ACRES	% OF TOTAL AREA	WEIGHTING FACTOR (WF)
A	1	1	.01	50' x 3000'	3.4	3.3	.033
B	2	1	.26	450' x 3000'	31.0	30.0	.30
C	1	2	.26	50' x 1000'	1.1	1.2	.012
D	2	2	.50	450' x 1000'	10.3	10.0	.10
E	3	4	1.0	1000' x 2500'	57.4	55.5	.555

* See Table on Page A-6.

BOTTOMLAND HARDWOODS

VARIABLE V1 - Tree Species Association (see Appendix C for scientific names)

Non-mast / inedible seed producers: eastern cottonwood, black willow, American sycamore.

Hard mast producers: oaks, sweet pecan, other hickories.

Soft mast and other edible seed producers: red maple, sugarberry, green ash, boxelder, common persimmon, sweetgum, honeylocust, red mulberry, baldcypress, tupelogram, American elm, cedar elm, etc.

Class 1: Less than 25% of overstory canopy consists of mast or other edible-seed producing trees.

Class 2: 25% to 50% of overstory canopy consists of mast or other edible-seed producing trees, but hard mast producers constitute less than 10 % of the canopy.

Class 3: 25% to 50% of overstory canopy consists of mast or other edible-seed producing trees, and hard mast producers constitute more than 10 % of the canopy.

Class 4: Greater than 50% of overstory canopy consists of mast or other edible-seed producing trees, but hard mast producers constitute less than 20 % of the canopy.

Class 5: Greater than 50% of overstory canopy consists of mast or other edible-seed producing trees, and hard mast producers constitute more than 20 % of the canopy.

BOTTOMLAND HARDWOODS

VARIABLE V2 - Stand Maturity [i.e., average age of canopy-dominant and canopy-codominant trees]

Notes:

1. When the average age of canopy-dominant and canopy-codominant trees is unknown, average tree diameter at breast height (dbh) can be used to determine the Suitability Index for this variable.
2. Canopy-dominant and canopy co-dominant trees are those trees whose crown rises above or is an integral part of the stand's overstory.
3. For trees with buttress swell, dbh is the diameter measured at 12" above the swell.

Suitability Index Line Formulas, when age is known:

If age = 0 then SI = 0.
 If $0 < \text{age} \leq 3$ then $\text{SI} = .0033 * \text{age}$
 If $3 < \text{age} \leq 7$ then $\text{SI} = (.01 * \text{age}) - .02$
 If $7 < \text{age} \leq 10$ then $\text{SI} = (.017 * \text{age}) - .07$
 If $10 < \text{age} \leq 20$ then $\text{SI} = (.02 * \text{age}) - .1$
 If $20 < \text{age} \leq 30$ then $\text{SI} = (.03 * \text{age}) - .3$
 If $30 < \text{age} \leq 50$ then $\text{SI} = .02 * \text{age}$
 If age > 50 then SI = 1.0.

Suitability Index Line Formulas for bottomland hardwoods, when age is unknown:

If dbh = 0 then SI = 0
 If $0 < \text{dbh} \leq 5$ then $\text{SI} = .01 * \text{dbh}$
 If $5 < \text{dbh} \leq 8$ then $\text{SI} = (.017 * \text{dbh}) - .035$
 If $8 < \text{dbh} \leq 11$ then $\text{SI} = (.067 * \text{dbh}) - .436$
 If $11 < \text{dbh} \leq 14$ then $\text{SI} = (.1 * \text{dbh}) - .8$
 If $14 < \text{dbh} \leq 20$ then $\text{SI} = (.067 * \text{dbh}) - .338$
 If dbh > 20 then SI = 1.0.

BOTTOMLAND HARDWOODS

VARIABLE V3 - Understory / Midstory

Understory

SI Line Formulas for Understory Coverage:

If understory % = 0 then SI = .1
 If $0 < \text{un. \%} \leq 30$ then $\text{SI} = 0.03 * \text{un. \%} + .1$
 If $30 < \text{un. \%} \leq 60$ then SI = 1.0
 If $\text{un. \%} > 60$ then $\text{SI} = (-.01 * \text{un. \%}) + 1.6$

Midstory

SI Line Formulas for Midstory Coverage:

If midstory % = 0, then SI = 0.1
 If $0 < \text{mid. \%} \leq 20$ then $\text{SI} = .045 * \text{mid. \%} + .1$
 If $20 < \text{mid. \%} \leq 50$ then SI = 1.0
 If $\text{mid. \%} > 50$ then $\text{SI} = (-.01 * \text{mid. \%}) + 1.5$

#

$$\text{Understory / Midstory SI} = (\text{Understory SI} + \text{Midstory SI}) / 2.$$

BOTTOMLAND HARDWOODS

VARIABLE V4 - Hydrology

- Class 1. Forced drainage system which efficiently removes water from the surface year round.
- Class 2. Water table lowered relative to ground level so as to significantly reduce periods of inundation or water table raised so as to cause extended inundation or impoundment.
- Class 3. Hydrology essentially unaltered (area could contain small levees and/or ditches, provided that water regime has not been significantly altered).

BOTTOMLAND HARDWOODS

VARIABLE V5 - Size of Contiguous Forested Area

Note: Corridors less than 75 feet wide do not constitute a break in the forested area contiguity.

Class 1. 0 to 5 acres.

Class 2. 5.1 to 20 acres.

Class 3. 20.1 to 100 acres.

Class 4. 100.1 to 500 acres.

Class 5. > 500 acres.

BOTTOMLAND HARDWOODS

VARIABLE V6 - Suitability and Traversability of Surrounding Land Uses

Within a 0.5 mile of the perimeter of the site, determine the percent of the area that is occupied by each of the following land uses (must account for 100 percent of the area). Multiply the percentage of each land use by the suitability weighting factor shown below, add the adjusted percentages and divide by 100 for a suitability index for this variable, except that if 100% of the Surrounding Habitat is considered nonhabitat, SI equals 0.01.

LAND USE	Weighting factor	% of 0.5 mi. circle	Weighted Percent
Bottomland hardwood, other forested areas, marsh habitat, etc.	1.0	X	_____ = _____
Abandoned agriculture, overgrown fields, dense cover, etc.	0.6	X	_____ = _____
Pasture, hayfields, etc.	0.4	X	_____ = _____
Active agriculture.	0.2	X	_____ = _____
Nonhabitat: linear, residential, commercial, industrial development, etc.	0.0	X	_____ = _____
_____ / 100 = SI			

BOTTOMLAND HARDWOODS

VARIABLE V7 - Disturbance

The effect of disturbance is a factor of the distance to, and the type of, disturbance, hence both are incorporated in the SI formula.

Note: Linear and/or large project sites may be exposed to various types of disturbances at various distances. The SI for this variable should be weighted to account for those variances; see the example calculation of a weighted SI for Disturbance on Page A-7.

Distance Classes

- Class 1. 0 to 50 ft.
- Class 2. 50.1 to 500 ft.
- Class 3. > 500 ft.

Type Classes

- Class 1. Constant / Major (Major highways, industrial, commercial, major navigation.)
- Class 2. Frequent / Moderate. (Residential development, moderately used roads, waterways commonly used by small to mid-sized boats.)
- Class 3. Seasonal / Intermittent. (Agriculture, aquaculture.)
- Class 4. Insignificant. (Lightly Used roads and waterways, individual homes, levees, rights of-way.)

SI Formula: (Distance SI + Type SI) / 2, except that if Distance > 500 feet (Class 3) or Type is Insignificant (Class 4), HSI = 1.0.

Type Class

		1	2	3	4
Distance Class	1	.01	.26	.41	1
	2	.26	.50	.65	1
	3	1	1	1	1

COASTAL WETLAND PLANNING, PROTECTION AND RESTORATION ACT

Wetland Value Assessment Methodology and Community Models

I. INTRODUCTION

The Wetland Value Assessment (WVA) methodology is a quantitative habitat-based assessment methodology developed for use in prioritizing project proposals submitted for funding under the Coastal Wetlands Planning, Protection, and Restoration Act (CWPPRA) of 1990. The WVA quantifies changes in fish and wildlife habitat quality and quantity that are projected to be brought about as a result of a proposed wetland enhancement project. The results of the WVA, measured in Average Annual Habitat Units (AAHU's), can be combined with economic data to provide a measure of the effectiveness of a proposed project in terms of annualized cost per AAHU gained.

The WVA was developed by the Environmental Work Group (Group) assembled under the Planning and Evaluation Subcommittee of the CWPPRA Technical Committee; the Group includes members from each agency represented on the CWPPRA Task Force. The WVA was designed to be applied, to the greatest extent possible, using only existing or readily obtainable data.

The WVA has been developed strictly for use in ranking proposed CWPPRA projects; it is not intended to provide a detailed, comprehensive methodology for establishing baseline conditions within a project area. Some aspects of the WVA have been defined by policy and/or functional considerations of the CWPPRA; therefore, user-specific modifications may be necessary if the WVA is used for other purposes.

The WVA is a modification of the Habitat Evaluation Procedures (HEP) developed by the U.S. Fish and Wildlife Service (U.S. Fish and Wildlife Service 1980). HEP is widely used by the Fish and Wildlife Service and other Federal and State agencies in evaluating the impacts of development projects on fish and wildlife resources.

A notable difference exists between the two methodologies, however, in that HEP generally uses a species-oriented approach, whereas the WVA utilizes a community approach.

The WVA has been developed for application to the following coastal Louisiana wetland types: fresh marsh (including intermediate marsh), brackish marsh, saline marsh, and cypress-tupelo swamp. Future reference in this document to "wetland" or "wetland type" refers to one or more of those four communities.

II. WVA CONCEPT

The WVA operates under the assumption that optimal conditions for fish and wildlife habitat within a given coastal wetland type can be characterized, and that existing or predicted conditions can be compared to that optimum to provide an index of habitat quality. Habitat quality is estimated or expressed through the use of a mathematical model developed specifically for each wetland type. Each model consists of 1) a list of variables that are considered important in characterizing fish and wildlife habitat, 2) a Suitability Index graph for each variable, which defines the assumed relationship between habitat quality (Suitability Index) and different variable values, and 3) a mathematical formula that combines Suitability Index for each variable into a single value for wetland habitat quality; that single value is referred to as the Habitat Suitability Index, or HSI.

The Wetland Value Assessment models (Attachments 1-4) have been developed for determining the suitability of Louisiana coastal wetlands in providing resting, foraging, breeding, and nursery habitat to a diverse assemblage of fish and wildlife species. Models have been designed to function at a community level and therefore attempt to define an optimum combination of habitat conditions for all fish and wildlife species utilizing a given marsh type over a year or longer. Earlier attempts to capture other wetland functions and values such as storm-surge protection, flood water storage, water quality functions and nutrient import/export were abandoned due to the difficulty in defining unified model relationships and meaningful model outputs for such

a variety of wetland benefits. However, the ability of a Louisiana coastal wetland to provide those functions and values may be generally assumed to be positively correlated with fish and wildlife habitat quality as predicted through the WVA.

The output of each model (the HSI) is assumed to have a linear relationship with the suitability of a coastal wetland system in providing fish and wildlife habitat.

III. COMMUNITY MODEL VARIABLE SELECTION

Habitat variables considered appropriate for describing habitat quality in each wetland type were selected according to the following criteria:

- 1) the condition described by the variable had to be important in characterizing fish and wildlife habitat quality in the wetland type under consideration;
- 2) values had to be easily estimated and predicted based on existing data (e.g., aerial photography, LANDSAT, GIS systems, water quality monitoring stations, and interviews with knowledgeable individuals); and
- 3) the variable had to be sensitive to the types of changes expected to be brought about by typical wetland projects proposed under the CWPRA.

Variables for each model were selected through a two part procedure. The first involved a listing of environmental variables thought to be important in characterizing fish and wildlife habitat in coastal marsh or swamp systems.

The second part of the selection procedure involved reviewing variables used in species-specific HSI models published by the U.S. Fish and Wildlife Service. Review was limited to models for those fish and wildlife species known to inhabit Louisiana coastal wetlands, and included models for 10 estuarine fish and shellfish,

4 freshwater fish, 12 birds, 3 reptiles and amphibians, and 2 mammals (Attachment 7). The number of models included from each species group was dictated by model availability.

Selected HSI models were then grouped according to the wetland type(s) used by each species. Because most species for which models were considered are not restricted to one wetland type, most models were included in more than one wetland type group. Within each wetland type group, variables from all models were then grouped according to similarity (e.g., water quality, vegetation, etc.). Each variable was evaluated based on 1) whether it met the variable selection criteria; 2) whether another, more easily measured/predicted variable in the same or a different similarity group functioned as a surrogate; and 3) whether it was deemed suitable for the WVA application (e.g., some freshwater fish model variables dealt with riverine or lacustrine environments). Variables that did not satisfy those conditions were eliminated from further consideration. The remaining variables, still in their similarity groups, were then further eliminated or refined by combining similar variables and/or culling those that were functionally duplicated by variables from other models (i.e., some variables were used frequently in different models in only slightly different format, such as percent marsh coverage, salinity, etc.).

Variables selected from the HSI models were then compared to those identified in the first part of the selection procedure to arrive at a final list of variables to describe wetland habitat quality. That list includes six variables for each of the marsh types and three for the cypress-tupelo swamp (Attachments 1-4).

IV. SUITABILITY INDEX GRAPHS

Suitability Index graphs were constructed for each variable selected within a wetland type. A Suitability Index (SI) graph is a graphical representation of how fish and wildlife habitat quality or "suitability" of a given wetland type is predicted to change as values of the given variable change, and allows the model user to numerically describe, through a Suitability Index, the habitat quality of a wetland area for any variable value. Each Suitability

Index ranges from 0.0 to 1.0, with 1.0 representing the optimum condition for the variable in question.

A variety of resources were utilized to construct each Suitability Index (SI) graph, including personal knowledge of Group members, the species HSI models from which the final list of variables was partially derived, consultation with other professionals and researchers outside the Group, and published and unpublished data and studies. An important "non-biological" constraint on SI graph development was the need to insure that graph relationships were not counter to the purpose of the CWPPRA, that is, the long term creation, restoration, protection, or enhancement of coastal vegetated wetlands. That constraint was most operative in defining SI graphs for Variable 1 under each marsh model (see discussion below).

The process of graph development was one of constant evolution, feedback, and refinement; the form of each Suitability Index graph was decided upon through consensus among Group members.

V. SUITABILITY INDEX GRAPH ASSUMPTIONS

Suitability Index graphs were developed according to the following assumptions:

1. Fresh/Intermediate Marsh Model

Variable V_1 - Percent of wetland covered by persistent emergent vegetation (≥ 10 percent canopy cover). Persistent emergent vegetation plays an important role in coastal wetlands by providing foraging, resting, and breeding habitat for a variety of fish and wildlife species; and by providing a source of detritus and energy for lower trophic organisms that form the basis for the food chain. An area with no marsh (i.e., shallow open water) is assumed to have minimal habitat suitability in terms of this variable, and is assigned an SI of 0.1.

Optimum vegetation coverage in a fresh/intermediate marsh is

assumed to occur at 100 percent persistent emergent vegetation cover (SI=1.0). That assumption is dictated primarily by the constraint of not having graph relationships conflict with the CWPPRA's purpose of long term creation, restoration, protection, or enhancement of coastal vegetated wetlands. The Group had originally developed a strictly biologically-based graph defining optimum habitat conditions at marsh cover values between 60 and 80 percent, and sub-optimum habitat conditions at 100 percent cover. However, application of that graph, in combination with the time analysis used later in the evaluation process, often reduced project benefits or generated a net loss of habitat quality through time with the project. Those situations arose primarily when: existing (baseline) emergent vegetation cover exceeded the optimum (> 80 percent); the project was predicted to maintain baseline cover values; and without the project the marsh was predicted to degrade, with a concurrent decline in percent emergent vegetation cover into the optimum range (60-80 percent). The time factor aggravated the situation when the without-project degradation was not rapid enough to reduce marsh cover values significantly below the optimum range, or below the baseline SI, within the 20-year evaluation period. In those cases, the analysis would show net negative benefits for the project, and positive benefits for letting the marsh degrade rather than maintaining the existing marsh. Coupling that situation with the presumption that marsh conditions are not static, and that Louisiana will continue to lose coastal emergent marsh; and taking into account the purpose of the CWPPRA, the Group decided that, all other factors being equal, the WVA should favor projects that maximize emergent marsh creation, maintenance, and protection. Therefore, the Group agreed to deviate from a strict biologically-based habitat suitability graph for V₁ by setting optimum habitat conditions at 100 percent marsh cover.

Variable V₂- Percent of open water area dominated (> 50 percent canopy cover) by aquatic vegetation. Fresh and intermediate marshes often support diverse communities of floating-leaved and submerged aquatic plants that provide important food and cover to a wide variety of fish and wildlife species. A fresh/intermediate open water area with

no, aquatics is assumed to have low suitability ($SI=0.1$). Optimum condition ($SI=1.0$) is assumed to occur when 100 percent of the open water is dominated by aquatic vegetation. Habitat suitability may be assumed to decrease with aquatic plant coverage approaching 100 percent due to the potential for mats of aquatic vegetation to hinder fish and wildlife utilization; to adversely affect water quality by reducing photosynthesis by phytoplankton and other plant forms due to shading; and contribute to oxygen depletion spurred by warm-season decay of large quantities of aquatic vegetation. The Group recognized, however, that those affects were highly dependent on the dominant aquatic plants species, their growth forms, and their arrangement in the water column; thus, it is possible to have 100 percent cover of a variety of floating and submerged aquatic plants without the above-mentioned problems due to differences in plant growth form and stratification of plants through the water column. Because predictions of which species may dominate at any time in the future would be tenuous, at best, the Group decided to simplify the graph and define optimum conditions at 100 percent aquatic cover.

Variable V_3 - Marsh edge and interspersions. This variable takes into account the relative juxtaposition of marsh and open water for a given marsh:open water ratio, and is measured by comparing the project area to sample illustrations (Attachment 5) depicting different degrees of interspersions. Interspersions are assumed to be especially important when considering the value of an area as foraging and nursery habitat for freshwater and estuarine fish and shellfish; the marsh/open water interface represents an ecotone where prey species often concentrate, and where post-larval and juvenile organisms can find cover. Isolated marsh ponds are often more productive in terms of aquatic vegetation than are larger ponds due to decreased turbidities, and, thus, may provide more suitable waterfowl habitat. However, interspersions can be indicative of marsh degradation, a factor taken into consideration in assigning suitability indices to the various Interspersions Types.

A relatively high degree of interspersions in the form of stream courses and tidal channels (Interspersions Type 1, Attachment 5) is assumed to be optimal ($SI=1.0$); streams and

channels offer interspersions, yet are not indicative of active marsh deterioration. Areas exhibiting a high degree of marsh cover are also ranked as optimum, even though interspersions may be low, to avoid conflicts with the premises underlying the SI graph for variable V_1 . Without such an allowance, areas of relatively healthy, solid marsh, or projects designed to create marsh, would be penalized with respect to interspersions. Numerous small marsh ponds (Interspersions Type 2) offer a high degree of interspersions, but are also usually indicative of the beginnings of marsh break-up and degradation, and are therefore assigned a more moderate SI of 0.6. Large open water areas (Interspersions Types 3 and 4) offer lower interspersions values and usually indicate advanced stages of marsh loss, and are thus assigned SI's of 0.4 and 0.2, respectively. The lowest expression of interspersions (i.e., no emergent marsh at all within the project area) is assumed to be least desirable and is assigned an SI=0.1.

Variable V_4 - Percent of open water area \leq 1.5 feet deep in relation to marsh surface. Shallow water areas are assumed to be more biologically productive than deeper water due to a general reduction in sunlight, oxygen, and temperature as water depth increases. Also, shallower water provides greater bottom accessibility for certain species of waterfowl, better foraging habitat for wading birds, and more favorable conditions for aquatic plant growth. Optimum depth in a fresh/intermediate marsh is assumed to occur when 80 to 90 percent of the open water area is less than or equal to 1.5 feet deep. The value of deeper areas in providing drought refugia for fish, alligators and other marsh life is recognized by assigning an SI=0.6 (i.e., sub-optimal) if all of the open water is less than or equal to 1.5 feet deep.

Variable V_5 - Mean high salinity during the growing season. It is assumed that periods of high salinity are most detrimental in a fresh/intermediate marsh when they occur during the growing season (defined as March through November, based on dates of first and last frost contained in Soil Conservation Service soil surveys for coastal Louisiana). Mean high salinity is defined as the average of the upper 33 percent of salinity readings taken during a

specified period of record. Optimum condition in fresh marsh is assumed to occur when mean high salinity during the growing season is less than 2 parts per thousand (ppt). Optimum condition in intermediate marsh is assumed to occur when mean high salinity during the growing season is less than 4 ppt.

Variable V_6 - Aquatic organism access. Access by aquatic organisms, particularly estuarine fishes and shellfishes, is considered to be a critical component in assessing the "quality" or suitability of a given marsh system to provide habitat to those species. Additionally, a marsh with a relatively high degree of access by default also exhibits a relatively high degree of hydrologic connectivity with adjacent systems, and therefore may be considered to contribute more to nutrient exchange than would a marsh exhibiting a lesser degree of access. The Suitability Index for V_7 is determined by calculating an "Access Value" based on the interaction between the percentage of the project area wetlands considered accessible by estuarine organisms during normal tidal fluctuations, and the type of man-made structures (if any) across identified points of ingress/egress (bayous, canals, etc.). Standardized procedures for calculating the Access Value have been established (Attachment 6). Optimum condition is assumed to exist when all of the study area is accessible and the access points are entirely open and unobstructed. A fresh/intermediate marsh with no access is assigned an $SI=0.3$, reflecting the assumption that, while fresh/intermediate marshes are important to some species of estuarine fishes and shellfish, such a marsh lacking access continues to provide benefits to a wide variety of other wildlife and fish species, and is not without habitat value.

2. Brackish Marsh Model

Variable V_1 - Percent of wetland covered by persistent emergent vegetation (≥ 10 percent canopy cover). Refer to the V_1 discussion under the fresh/intermediate marsh model for a discussion of the importance of persistent emergent vegetation in coastal marshes. The V_1 Suitability Index graph in the brackish marsh model is identical to that in

the fresh/intermediate model.

Variable V_2 - Percent of open water area dominated (> 50 percent canopy cover) by aquatic vegetation. Like fresh/intermediate marshes, brackish marshes have the potential to support aquatic plants that serve as important sources of food and cover for a wide variety of wildlife. However, brackish marshes generally do not support the amounts and kinds of aquatic plants that occur in fresh/intermediate marshes (although certain species, such as widgeon-grass, can occur abundantly under certain conditions). Therefore, a brackish marsh entirely lacking aquatic plants is assigned an $SI=0.3$. It is assumed that optimum open water coverage of aquatic plants in a brackish marsh occurs at 100 percent aquatic cover.

Variable V_3 - Marsh edge and interspersions. The Suitability Index graph for edge and interspersions in the brackish marsh model is the same as that in the fresh/intermediate marsh model.

Variable V_4 - Open water depth in relation to marsh surface. As in the fresh/intermediate model, shallow water areas in brackish marsh habitat are assumed to be important. However, brackish marsh generally exhibits deeper open water areas than fresh marsh due to tidal scouring. Therefore, the SI graph is constructed so that lower percentages of shallow water receive higher SI values relative to fresh/intermediate marsh. Optimum open water depth condition in a brackish marsh is assumed to occur when 70 to 80 percent of the open water area is less than or equal to 1.5 feet deep.

Variable V_5 - Average annual salinity. The suitability index graph is constructed to represent optimum average annual salinity condition at between 0 ppt and 10 ppt. The Group acknowledges that average annual salinities below 6 ppt will effectively define a marsh as fresh or intermediate, not brackish. However, the suitability index graph makes allowances for lower salinities (i.e., < 6 ppt) to account for occasions when there is a trend of decreasing salinities through time toward a more intermediate condition. Implicit in keeping the graph at optimum for salinities less than 6

ppt is the assumption that lower salinities are not detrimental to a brackish marsh. However, average annual salinities greater than 10 ppt are assumed to be progressively more harmful to brackish marsh vegetation, as illustrated in the downward sloping right leg of the suitability index graph. Average annual salinities greater than 16 ppt are assumed to be representative of those found in a saline marsh, and thus are not considered in the brackish marsh model.

Variable V_6 - Aquatic organism access. The general rationale and procedure behind the V_6 Suitability Index graph for the brackish marsh model is identical to that established for the fresh/intermediate model. However, brackish marshes are assumed to be more important as providers of habitat to estuarine fish and shellfish than fresh/intermediate marshes. Therefore, a brackish marsh providing no access is assigned an SI of 0.1.

3. Saline Marsh Model

Variable V_1 - Percent of wetland covered by persistent emergent vegetation (≥ 10 percent canopy cover). Refer to the V_1 discussion under the fresh/intermediate marsh model for a discussion of the importance of persistent emergent vegetation in coastal marshes. The V_1 Suitability Index graph in the saline marsh model is identical to that in the fresh/intermediate and brackish models.

Variable V_2 - Percent of open water area dominated (> 50 percent canopy cover) by aquatic vegetation. Refer to the V_2 discussion under the brackish marsh model for a discussion of persistent emergent vegetation in more saline coastal marshes. The V_2 Suitability Index graph in the saline marsh model is identical to that in the brackish model.

Variable V_3 - Marsh edge and interspersions. The Suitability Index graph for edge and interspersions in the saline marsh model is the same as that in the fresh/intermediate and brackish marsh models.

Variable V₄- Open water depth in relation to marsh surface.
The Suitability Index graph for open water depth in the saline marsh is similar to that for brackish marsh, where optimum conditions are assumed to occur when 70 to 80 percent of the open water area is less than or equal to 1.5 feet deep. However, at 100 percent shallow water, the saline graph yields an SI= 0.5 rather than 0.6 for the brackish model. That change reflects the increased abundance of tidal channels and generally deeper water conditions prevailing in a saline marsh due to increased tidal influences, and the importance of those tidal channels to estuarine organisms.

Variable V₅- Average annual salinity. The Suitability Index graph is constructed to represent optimum salinity conditions at between 9 ppt and 21 ppt. The Group acknowledges that average annual salinities between 9 and 12 ppt will effectively define a marsh as brackish, not saline. However, the suitability index graph makes allowances for lower salinities (i.e., < 12 ppt) to account for occasions when there is a trend of decreasing salinities through time toward a more brackish condition. Implicit in keeping the graph at optimum for salinities less than 12 ppt is the assumption that lower salinities (9-12 ppt) are not detrimental to a saline marsh. Average annual salinities greater than 21 ppt are assumed to be slightly stressful to saline marsh vegetation, as illustrated in the downward sloping right leg of the suitability index graph.

Variable V₆- Aquatic organism access. The Suitability Index graph for aquatic organism access in the saline marsh model is the same as that in the brackish marsh model.

4. Cypress-Tupelo Swamp Model

Variable V₁- Water regime. Four water regime categories are described for the cypress-tupelo swamp model. The optimum water regime for a cypress-tupelo swamp is assumed to be seasonal flooding (SI=1.0); seasonal flooding with periodic drying cycles is assumed to contribute to increased nutrient cycling (primarily through oxidation and decomposition of accumulated detritus), increased vertical structure

complexity (due to growth of other plants on the swamp floor), and increased recruitment of dominant overstory trees. Semipermanent flooding is also assumed to be desirable, as reflected in the $SI=0.8$ for that water regime category. Permanent flooding is assumed to be the least desirable ($SI=0.2$).

Variable V_2 - Water flow/exchange. This variable attempts to take into consideration the amounts and types of water inputs into a cypress-tupelo swamp. The Suitability Index graph is constructed under the assumption that abundant and consistent riverine input and water flow-through is optimum ($SI=1.0$), because under that regime the full functions and values of a cypress-tupelo swamp in providing fish and wildlife habitat are assumed to be maximized. Habitat suitability is assumed to decrease as water exchange between the swamp and adjacent systems is reduced. A swamp system with no water exchange (e.g., an impounded swamp where the only water input is through rainfall and the only water loss is through evapotranspiration and ground seepage) is assumed to be least desirable, and is assigned an $SI= 0.2$.

Variable V_3 - Average high salinity. Average high salinity is defined as the average of the upper 33 percent of salinity measurements taken during a specified period of record. Because baldcypress is salinity-sensitive, optimum conditions for baldcypress survival are assumed to occur at average high salinities less than 1 ppt. Habitat suitability is assumed to decrease rapidly at average high salinities in excess of 1 ppt.

VI. HABITAT SUITABILITY INDEX FORMULA

The final step in WVA model development was to construct a mathematical formula that combines all Suitability Indices for each wetland type into a single Habitat Suitability Index (HSI) value. Because the Suitability Indices range in value from 0.0 to 1.0, the HSI also ranges in from 0.0 to 1.0, and is a numerical representation of the overall or "composite" habitat quality of the particular wetland study area being evaluated. The HSI formula defines the aggregation of Suitability Indices in a manner unique

to each wetland type depending on how the formula is constructed.

Within an HSI formula, any Suitability Index can be weighted by various means to increase the power or "importance" of that variable relative to the other variables in determining the HSI. Additionally, two or more variables can be grouped together into subgroups to further isolate variables for weighting.

In constructing HSI formulas for the marsh models, the Group recognized that the primary focus of the CWPPRA is on vegetated wetlands, and that some marsh protection strategies could have adverse impacts to estuarine organism access. Therefore, the Group made an a priori decision to emphasize variables V_1 , V_2 , and V_6 by grouping and weighting them together. Weighting was facilitated by treating the grouped variables as a geometric mean. Variables V_3 , V_4 , and V_5 were grouped to isolate their influence relative to V_1 , V_2 , and V_6 .

For all marsh models, V_1 receives the strongest weighting. The relative weights of V_2 and V_6 differ by marsh model to reflect differing levels of importance for those variables between the marsh types. For example, the amount of aquatic vegetation was deemed more important in the context of a fresh/intermediate marsh than in a saline marsh, due to the relative contributions of aquatic vegetation between the two marsh types in terms of providing food and cover. Therefore, V_2 receives more weight in the fresh/intermediate HSI formula than in the saline HSI formula. Similarly, the degree of estuarine organism access was considered more important in a saline marsh than a fresh/intermediate marsh, and V_6 receives more weight in the saline HSI formula than in the fresh/intermediate formula.

As with the Suitability Index graphs, the Habitat Suitability Index formulas were developed by consensus among the Group members.

VI. BENEFIT ASSESSMENT

The net benefits of a proposed project are estimated by predicting

future habitat conditions under two scenarios: with the proposed project in place and without the proposed project. Specifically, predictions are made as to how the model variables will change through time under the two scenarios. Through that process, HSI's are established for baseline (pre-project) conditions and for future-with- and future-without-project scenarios for selected "target years" throughout the expected life of the project. Those HSI's are then multiplied by the acreage of wetland type known or expected to be present in the target years to arrive at Habitat Units.

Habitat Units (HU's) represent a numerical combination of quality (HSI) and quantity (acres) existing at any given point in time. The "benefit" of a project can be quantified by comparing HU's between the future-with and future-without-project scenarios. The difference in HU's between the two scenarios represents the net benefit attributable to the project in terms of habitat quantity and quality.

The HU's resulting from the future-with- and future-without-project scenarios are annualized, averaged out over the project life, and compared to determine the net gain in average annual HU's (AAHU's) attributable to the project. Net gain in AAHU's is then combined with annualized cost data to arrive at a cost per AAHU for the evaluated project. That figure is compared to the same figure from other projects in order to rank all proposed projects in order of cost per AAHU.

Revised June 2, 1993

WETLAND VALUE ASSESSMENT COMMUNITY MODEL

Fresh/Intermediate Marsh

Vegetation:

Variable V_1 Percent of wetland area covered by emergent vegetation ($\geq 10\%$ canopy cover).

Variable V_2 Percent of open water area dominated ($> 50\%$ canopy cover) by aquatic vegetation.

Interspersion:

Variable V_3 Marsh edge and interspersion.

Water Depth:

Variable V_4 Percent of open water area ≤ 1.5 feet deep, in relation to marsh surface.

Water Quality:

Variable V_5 Mean high salinity during the growing season (March through November).

Aquatic Organism Access:

Variable V_6 Aquatic organism access.

HSI Calculation:

$$HSI = \frac{[3.5 \times (SIV_1^3 \times SIV_2^{1.2} \times SIV_6^{0.5})^{(1/4.7)}] + \left[\frac{(SIV_3 + SIV_4 + SIV_5)}{3} \right]}{4.5}$$

FRESH/INTERMEDIATE MARSH

Variable V₁ Percent of wetland area covered by emergent vegetation ($\geq 10\%$ canopy cover).

Line Formulas

$$SI = (0.009 * \%) + 0.1$$

FRESH/INTERMEDIATE MARSH

Variable V₂ Percent of open water area dominated (> 50% canopy cover) by aquatic vegetation.

Line Formulas

$$SI = (0.009 * \%) + 0.1$$

FRESH/INTERMEDIATE MARSH

Variable V, Marsh edge and interspersions.

Suitability Graph

Instructions for Calculating SI for Variable 3:

1. Refer to Attachment 5 for examples of the different interspersions classes (=types).
2. Estimate percent of project area in each class and compute a weighted average to arrive at SIV. If the entire project area is solid marsh, assign an interspersions class #1 (SI=1.0). Conversely, if the entire project area is open water, assign an interspersions class #5 (SI=0.1).

FRESH/INTERMEDIATE MARSH

Variable V₄ Percent of open water area ≤ 1.5 feet deep, in relation to marsh surface.

Line Formulas

If $0 \leq \% < 80$, then $SI = (0.01125 * \%) + 0.1$

If $80 \leq \% < 90$, then $SI = 1.0$

If $\% \geq 90$, then $SI = (-0.04 * \%) + 4.6$

FRESH/INTERMEDIATE MARSH

Variable V_5 Mean high salinity during the growing season (March through November).

Line Formulas

Fresh Marsh:

If $0 \leq \text{ppt} < 2$, then $SI = 1.0$
If $2 \leq \text{ppt} < 4$, then $SI = (-0.4 * \text{ppt}) + 1.8$
If $4 \leq \text{ppt} \leq 5$ then $SI = (-0.1 * \text{ppt}) + 0.6$

Intermediate Marsh:

If $0 \leq \text{ppt} < 4$, then $SI = 1.0$
If $4 \leq \text{ppt} \leq 8$, then $SI = (-0.2 * \text{ppt}) + 1.8$

NOTE: Mean high salinity is defined as the average of the upper 33 percent of salinity readings taken during the period of record.

FRESH/INTERMEDIATE MARSH

Variable V₆ Aquatic organism access.

Line Formula

$$SI = (0.7 * \text{Access Value}) + 0.3$$

NOTE: Access Value = P * R, where "P" = percentage of wetland area considered accessible by estuarine organisms during normal tidal fluctuations, and "R" = Structure Rating.

Refer to Attachment 6 "Procedure For Calculating Access Value" for complete information on calculating "P" and "R" values.

Revised May 2, 1994

WETLAND VALUE ASSESSMENT COMMUNITY MODEL

Brackish Marsh

Vegetation:

Variable V_1 Percent of wetland area covered by emergent vegetation ($\geq 10\%$ canopy cover).

Variable V_2 Percent of open water area dominated ($> 50\%$ canopy cover) by aquatic vegetation.

Interspersion:

Variable V_3 Marsh edge and interspersion.

Water Depth:

Variable V_4 Percent of open water area ≤ 1.5 feet deep, in relation to marsh surface.

Water Quality:

Variable V_5 Average annual salinity.

Aquatic Organism Access:

Variable V_6 Aquatic organism access.

HSI Calculation:

$$HSI = \frac{[3.5 \times (SIV_1^3 \times SIV_2 \times SIV_6)^{(1/5)}] + \left[\frac{(SIV_3 + SIV_4 + SIV_5)}{3} \right]}{4.5}$$

BRACKISH MARSH

Variable V₁ Percent of wetland area covered by emergent vegetation ($\geq 10\%$ canopy cover).

Line Formulas

$$SI = (0.009 * \%) + 0.1$$

BRACKISH MARSH

Variable V₂ Percent of open water area dominated (> 50% canopy cover) by aquatic vegetation.

Line Formulas

$$SI = (0.007 * \%) + 0.3$$

BRACKISH MARSH

Variable V₃ Marsh edge and interspersions.

Suitability Graph

Instructions for Calculating SI for Variable 3:

1. Refer to Attachment 5 for examples of the different interspersions classes (=types).
2. Estimate percent of project area in each class and compute a weighted average to arrive at SIV. If the entire project area is solid marsh, assign an interspersions class #1 (SI=1.0). Conversely, if the entire project area is open water, assign an interspersions class #5 (SI=0.1).

BRACKISH MARSH

Variable V₁ Percent of open water area ≤ 1.5 feet deep, in relation to marsh surface.

Line Formulas

If $0 \leq \% < 70$, then $SI = (0.01286 * \%) + 0.1$

If $70 \leq \% < 80$, then $SI = 1.0$

If $\% \geq 80$, then $SI = (-0.02 * \%) + 2.6$

BRACKISH MARSH

Variable V₅ Average annual salinity.

Line Formulas

If $0 \leq \text{ppt} < 10$, then $SI = 1.0$

If $\text{ppt} \geq 10$, then $SI = (-0.15 * \text{ppt}) + 2.5$

BRACKISH MARSH

Variable V, Aquatic organism access.

Line Formula

$$SI = (0.9 * \text{Access Value}) + 0.1$$

Note: Access Value = $P * R$, where "P" = percentage of wetland area considered accessible by estuarine organisms during normal tidal fluctuations, and "R" = Structure Rating.

Refer to Attachment 6 "Procedure For Calculating Access Value" for complete information on calculating "P" and "R" values.

WETLAND VALUE ASSESSMENT COMMUNITY MODEL

Cypress-Tupelo Swamp

Water Depth and Duration:

Variable V_1 Water regime.

Water Quality:

Variable V_2 Water flow/exchange.

Variable V_3 Average high salinity.

HSI Calculation:

$$HSI = (SI_{V_1} \times SI_{V_2} \times SI_{V_3})^{1/3}$$

CYPRESS-TUPELO SWAMP

Variable V₁ Water regime.

Suitability Graph

- 1 - Permanently Flooded: water covers the substrate throughout the year in all years.
- 2 - Semipermanently Flooded: surface water is present throughout the growing season in most years.
- 3 - Seasonally Flooded: surface water is present for extended periods, especially in the growing season, but is absent by the end of the growing season in most years.
- 4 - Temporarily Flooded: surface water is present for brief periods during the growing season, but the water table usually lies well below the surface for most of the season.

CYPRESS-TUPELO SWAMP

Variable V₂ Water flow/exchange.

- 1 - Receives abundant and consistent riverine input and through-flow.
- 2 - Moderate water exchange, through riverine and/or tidal input.
- 3 - Limited water exchange, through riverine and/or tidal input.
- 4 - No water exchange (stagnant, impounded).

CYPRESS-TUPELO SWAMP

Variable V₃ Average high salinity.

Line Formulas

If $0 \leq \text{ppt} < 1$, then $SI = 1.0$

If $1 \leq \text{ppt} < 2$, then $SI = (-0.5 * \text{ppt}) + 1.5$

If $2 \leq \text{ppt} < 2.5$, then $SI = (-1.0 * \text{ppt}) + 2.5$

If $\text{ppt} \geq 2.5$, then $SI = 0$

Average high salinity is defined as the average of the upper 33 percent of salinity readings taken during the period of record.

Revised June 2, 1993

PROCEDURE FOR CALCULATING ACCESS VALUE

1. Determine the percent of wetland area accessible by estuarine organisms during normal tidal fluctuations (P) for baseline (TY0) conditions. P may be determined by examination of aerial photography, knowledge of field conditions, or other appropriate methods.
2. Determine the Structure Rating (R) for each project structure as follows:

<u>Structure Type</u>	<u>Rating</u>
open system	1.0
rock weir set at 1ft BML ¹ , w/ boat bay	0.8
rock weir with boat bay	0.6
rock weir set at \geq 1ft BML	0.6
slotted weir with boat bay	0.6
open culverts	0.5
weir with boat bay	0.5
weir set at \geq 1ft BML	0.5
slotted weir	0.4
flapgated culvert with slotted weir	0.35
variable crest weir	0.3
flapgated variable crest weir	0.25
flapgated culvert	0.2
rock weir	0.15
fixed crest weir	0.1
solid plug	0.0001

For each structure type, the rating listed above pertains only to the standard structure configuration and assumes that the structure is operated according to common operating schedules consistent with the purpose for which that structure is designed. In the case of a "hybrid" structure or a unique application of one of the above-listed types (including unique or "non-standard" operational schemes), the WVA analyst(s) may assign an appropriate Structure Rating between 0.0001 and 1.0 that most closely approximates the relative degree to which the structure in question would allow ingress/egress of estuarine organisms. In those cases, the rationale used in developing the new Structure Rating shall be documented.

3. Determine the Access Value. Where multiple openings equally affect a common "accessible unit", the Structure Rating (R) of

¹ Below Marsh Level

the structure proposed for the "major" access point for the unit will be used to calculate Access Value. The designation of "major" will be made by the Environmental Work Group. An "accessible unit" is defined as a portion of the total accessible area that is served by one or more access routes (canals, bayous, etc.), yet is isolated in terms of estuarine organism access to or from other units of the project area. Isolation factors include physical barriers that prohibit further movement of estuarine organisms, such as natural levee ridges, and spoil banks; and dense marsh that lacks channels, trenasses, and similar small connections that would, if present, provide access and intertidal refugia for estuarine organisms.

Access Value should be calculated according to the following examples (Note: for all examples, P for TY0 = 90%. That designation is arbitrary and is used only for illustrative purposes; P could be any percentage from 0% to 100%):

- a. One opening into area; no structure.

$$\begin{aligned}\text{Access Value} &= P \\ &= .90\end{aligned}$$

- b. One opening into area that provides access to the entire 90% of the project area deemed accessible. A flapgated culvert with slotted weir is placed across the opening.

$$\begin{aligned}\text{Access Value} &= P * R \\ &= .90 * .6 \\ &= .54\end{aligned}$$

- c. Two openings into area, each capable by itself of providing full access to the 90% of the project area deemed accessible in TY0. Opening #2 is determined to be the major access route relative to opening #1. A flapgated culvert with slotted weir is placed across opening #1. Opening #2 is left unaltered.

$$\begin{aligned}\text{Access Value} &= P \\ &= .90\end{aligned}$$

Note: Structure #1 had no bearing on the Access Value calculation because its presence did not reduce access (opening #2 was determined to be the major access route, and access through that route was not altered).

- d. Two openings into area. Opening #1 provides access to an

accessible unit comprising 30% of the area. Opening #2 provides access to an accessible unit comprising the remaining 60% of the project area. A flapgated culvert with slotted weir is placed across #1. Opening #2 is left open.

Access Value = weighted avg. of Access Values of the two accessible units

$$\begin{aligned}
 &= ([P_1 * R_1] + [P_2 * R_2]) / (P_1 + P_2) \\
 &= ([.30 * 0.6] + [.60 * 1.0]) / (.30 + .60) \\
 &= (.18 + .60) / .90 \\
 &= .78 / .90 \\
 &= .87
 \end{aligned}$$

Note: $P_1 + P_2 = .90$, because only 90 percent of the study area was determined to be accessible at TY0.

- e. Three openings into area, each capable of providing full access to the entire area independent of the others. Opening #3 is determined to be the major access route relative to openings #1 and #2. Opening #1 is blocked with a solid plug. Opening #2 is fitted with a flapgated culvert with slotted weir, and opening #3 is left open.

$$\begin{aligned}
 \text{Access Value} &= P \\
 &= .90
 \end{aligned}$$

Note: Structures #1 and #2 had no bearing on the Access Value calculation because their presence did not reduce access (opening #3 was determined to be the major access route, and access through that route was not altered).

- f. Three openings into area, each capable of providing full access to the entire area independent of the others. Opening #2 is determined to be the major access route relative to openings #1 and #3. Opening #1 is blocked with a solid plug. Opening #2 is fitted with a flapgated culvert with slotted weir, and opening #3 is fitted with a fixed crest weir.

$$\begin{aligned}
 \text{Access Value} &= P * R_2 \\
 &= .90 * .6 \\
 &= .54
 \end{aligned}$$

Note: Structures #1 and #3 had no bearing on the Access Value calculation because their presence did not reduce access. Opening #2 was determined beforehand to be the major access route; thus, it was the flapgated culvert with slotted weir across that opening that actually served to limit access.

- g. Three openings into area. Opening #1 provides access to an accessible unit comprising 20% of the area. Openings #2 and #3 provide access to an accessible unit comprising the remaining 70% of the area, and within that area, each is capable by itself of providing full access. However, opening #3 is determined to be the major access route relative to opening #2. Opening #1 is fitted with an open culvert, #2 with a flapgated culvert with slotted weir, and #3 with a fixed crest weir.

$$\begin{aligned}
 \text{Access Value} &= ([P_1 \cdot R_1] + [P_2 \cdot R_2]) / (P_1 + P_2) \\
 &= ([.20 \cdot .7] + [.70 \cdot .6]) / (.20 + .70) \\
 &= (.14 + .42) / .90 \\
 &= .56 / .90 \\
 &= .62
 \end{aligned}$$

- h. Three openings into area. Opening #1 provides access to an accessible unit comprising 20% of the area. Opening #2 provides access to an accessible unit comprising 40% of the area, and opening #3 provides access to the remaining 30% of the area. Opening #1 is fitted with an open culvert, #2 a flapgated culvert with slotted weir, and #3 a fixed crest weir.

$$\begin{aligned}
 \text{Access Value} &= ([P_1 \cdot R_1] + [P_2 \cdot R_2] + [P_3 \cdot R_3]) / (P_1 + P_2 + P_3) \\
 &= ([.20 \cdot .7] + [.40 \cdot .6] + [.30 \cdot .1]) / (.20 + .40 + .30) \\
 &= (.14 + .24 + .03) / .90 \\
 &= .41 / .90 \\
 &= .46
 \end{aligned}$$

APPENDIX J

PHONE MEMORANDUM FROM MR. LARRY HARTZOG

APPENDIX J

PHONE MEMO FROM MR. LARRY HARTZOG

FILE: 071-04

DATE: 10/23/95

TIME: 1400

TO: Kerry Higgins

DISCUSSION:

In reference to the likelihood of Pallid Sturgeon in the vicinity of Belle Chasse. Mr. Hartzog stated that our general dredge location is at River Mile 70; nearest sighting of sturgeon was between River Mile 95 and 100. Usually they are located along the steepest portion of the side slopes of the River, not in the center. The steep side slopes are not likely to hold the sand that the dredge contractor is mining, they are usually composed of clays.

Re: Estelle Plantation

Dear Ms. Higgins:

I have reviewed the project description and map you provided. No bald eagle nests are located in the general vicinity of the project. Nest #57 is located approximately 1.5 miles SSE of proposed project, and will not be affected by the project. Please contact me if you require additional information.

Sincerely,

Thomas J. Hess, Jr.

RE: Solicitation of views on Threatened, Endangered and Rare Species for
Bunge site on the Luling USGS 7.5 minute topographic quad.

Dear Ms. Higgins:

Personnel of the Natural Heritage Program have reviewed the preliminary data for the captioned project. In reviewing our database, the only rare, threatened, or endangered species or critical habitat found within the area of interest that lies in Louisiana was a Bald Eagle nest approximately 4.5 miles WNW of the site that has been verified active for the last ten years. No state or federal parks, wildlife refuges, or wildlife management areas are known within the Louisiana boundaries. You should also be aware that this site is located within the Coastal Zone and you can contact the Coastal Management Division of the Department of Natural Resources at (504) 342-7591 for more information.

The Louisiana Natural Heritage Program has compiled data on rare, endangered, or otherwise significant plant and animal species, plant communities, and other natural features throughout the state of Louisiana. Heritage reports summarize the existing information known at the time of the request regarding the location in question. They should not be considered final statements on the biological elements or areas being considered, nor should they be substituted for on-site surveys required for environmental assessments.

The Louisiana Natural Heritage Program requires that this office be acknowledged in all reports for data to the user.

Sincerely,

A handwritten signature in cursive script that reads "Gary Lester".

RE: Solicitation of views on Threatened, Endangered and Rare Species for
the PP1 site on the Chalmette USGS 7.5 minute topographic quad.

Dear Ms. Higgins:

Personnel of the Natural Heritage Program have reviewed the preliminary data for the captioned project. In reviewing our database, no rare, threatened, or endangered species or critical habitats were found within the area of interest that lies in Louisiana. No state or federal parks, wildlife refuges, or wildlife management areas are known within the Louisiana boundaries. You should be aware, however, that *Scaphirhynchus albus*, a federally listed endangered species, is known to exist in the Mississippi River near the area of interest. Additionally, the site is located within the Coastal Zone. You can contact Coastal Management Division of the Department of Natural Resources at (504) 342-7591 for more information.

The Louisiana Natural Heritage Program has compiled data on rare, endangered, or otherwise significant plant and animal species, plant communities, and other natural features throughout the state of Louisiana. Heritage reports summarize the existing information known at the time of the request regarding the location in question. They should not be considered final statements on the biological elements or areas being considered, nor should they be substituted for on-site surveys required for environmental assessments.

New Orleans, Louisiana 70160-0267

Dear Mr. Schroeder:

The following material is provided in response to your May 26, 1995, letter requesting information on threatened and endangered species that could be affected by the Estelle Plantation Partnership Permit Application, SE (Jefferson Parish Wetlands) 238, or six alternate locations for the proposed project. This information is provided in accordance with the Endangered Species Act of 1978, as amended.

The proposed work in the permit application is located in Jefferson Parish, and the subsequently identified alternate sites are located in Jefferson, St. Charles, and Plaquemines Parishes. Federally listed threatened (T) and Endangered (E) species found in the respective Parishes are listed below.

Jefferson Parish

Bald Eagle (T)
Brown Pelican (E)
Piping Plover (T)
Pallid Sturgeon (E)
Kemp's Ridley Sea Turtle (E)

St. Charles Parish

Bald Eagle
Brown Pelican
Gulf Sturgeon (T)
Pallid Sturgeon

Plaquemines Parish

Bald Eagle
Brown Pelican
Piping Plover
Pallid Sturgeon
Green Sea Turtle (T)
Kemp's Ridley Sea Turtle
Loggerhead Sea Turtle (T)

The National Marine Fisheries Service is responsible for aquatic marine threatened or endangered species (e.g., sea turtles). Please, contact Ms. Colleen Coogan (813/570-5312) in St. Petersburg, Florida, for information concerning those species.

The bald eagle is the only species within our jurisdiction that might be affected by construction of the project at the alternate site located south of the originally proposed location (marked with an "EG")

on the map we received). The Jean Lafitte eagle nest (nest number 57) is located within one mile of that alternate site. The Corps should consult with the Fish and Wildlife Service on any activities occurring within one mile of a nest during the nesting season (i.e., October 1 to May 15).

If the proposed alternate site "EG" is selected for project implementation, issuance of the permit would constitute a major Federal action, subject to Section 7(c) of the Endangered Species Act, as amended. In that event, your staff must determine the effects, if any, the proposed work will have on the bald eagle. That assessment of impacts to the bald eagle can be included in any National Environmental Policy Act document being prepared for the permit, or impacts can be addressed in a separate Biological Assessment. In either case, assessment of the impacts to the bald eagle should include:

1. interviews with recognized experts on the bald eagle, including the Fish and Wildlife Service, state conservation agencies, universities, etc.;
2. literature reviews or other scientific information to determine species distribution, habitat needs, and other biological requirements;
3. analysis of the impacts (including cumulative impacts) of the proposed work on individuals and populations of each bald eagle and its habitat; and
4. analysis of the effects that each alternative plan would have on the bald eagle.

If you determine that the proposed work may affect the bald eagle, you must request, in writing, a formal consultation from this office pursuant to Section 7(a) of the Endangered Species Act. A request to initiate formal consultation can accompany submission of the impact assessment to the Fish and Wildlife Service.

Thank you for your interest in conserving threatened and endangered species. If you need further information, including a list of recognized experts for the bald eagle, please contact David Walther of this office at (318) 262-6662, extension 227.

Sincerely,

Russell C. Watson
Acting Field Supervisor

FAMILY TYPE BY PRESENCE OF OWN CHILDREN

Families	
With own children under 18 years	204 296
Number of own children under 18 years	101 239
Married-couple families	187 849
With own children under 18 years	86 542
Number of own children under 18 years	163 548
Female householder, no husband present	24 969
With own children under 18 years	12 290
Number of own children under 18 years	20 541

MARITAL STATUS

Male, 15 years and over	
Single	294 280
Now married, except separated	85 218
Separated	178 715
Widowed	7 573
Divorced	7 210
Female, 15 years and over	15 564
Single	317 374
Now married, except separated	68 585
Separated	177 659
Widowed	9 216
Divorced	40 897

Fig 1. Selected Population and Housing Characteristics: 1990
St. Charles Parish, Louisiana

The population counts set forth herein are subject to possible correction for undercount or overcount. The United States Department of Commerce is considering whether to correct these counts and will publish corrected counts, if any, not later than July 1, 1991.

Total population	42,437	Total housing units	16,016
SEX		OCCUPANCY AND TENURE	
Male	20,742	Occupied housing units	14,333
Female	21,695	Owner occupied	11,302
		Percent owner occupied	78.9
AGE		Renter occupied	3,031
Under 5 years	3,896	Vacant housing units	1,683
5 to 17 years	9,483	For seasonal, recreational, or occasional use	161
18 to 20 years	1,544	Homeowner vacancy rate (percent)	2.5
21 to 24 years	2,238	Rental vacancy rate (percent)	16.3
25 to 44 years	14,809	Persons per owner-occupied unit	3.00
45 to 54 years	4,045	Persons per renter-occupied unit	2.72
55 to 59 years	1,710	Units with over 1 person per room	683
60 to 64 years	1,578	UNITS IN STRUCTURE	
65 to 74 years	1,957	1-unit, detached	11,413
75 to 84 years	895	1-unit, attached	439
85 years and over	282	2 to 4 units	1,100
Median age	30.3	5 to 9 units	596
Under 18 years	13,379	10 or more units	280
Percent of total population	31.5	Mobile home, trailer, other	2,188
65 years and over	3,134	VALUE	
Percent of total population	7.4	Specified owner-occupied units	9,124
HOUSEHOLDS BY TYPE		Less than \$50,000	2,180
Total households	14,333	\$50,000 to \$99,999	5,246
Family households (families)	11,422	\$100,000 to \$149,999	1,090
Married-couple families	9,138	\$150,000 to \$199,999	382
Percent of total households	63.8	\$200,000 to \$299,999	178
Other family, male householder	482	\$300,000 or more	48
Other family, female householder	1,802	Median (dollars)	68,000
Nonfamily households	2,911	CONTRACT RENT	
Percent of total households	20.3	Specified renter-occupied units	
Householder living alone	2,520	paying cash rent	2,656
Householder 65 years and over	828	Less than \$250	863
Persons living in households	42,086	\$250 to \$499	1,610
Persons per household	2.94	\$500 to \$749	137
GROUP QUARTERS		\$750 to \$999	35
Persons living in group quarters	351	\$1,000 or more	11
Institutionalized persons	314	Median (dollars)	294
Other persons in group quarters	37	RACE AND HISPANIC ORIGIN OF HOUSEHOLDER	
RACE AND HISPANIC ORIGIN		Occupied housing units	14,333
White	31,638	White	10,997
Black	10,253	Black	3,176
Percent of total population	24.2	Percent of occupied units	22.2
American Indian, Eskimo, or Aleut	113	American Indian, Eskimo, or Aleut	32
Percent of total population	0.3	Percent of occupied units	0.2
Asian or Pacific Islander	177	Asian or Pacific Islander	47
Percent of total population	0.4	Percent of occupied units	0.3
Other race	256	Other race	81
Hispanic origin (of any race)	1,070	Hispanic origin (of any race)	316
Percent of total population	2.5	Percent of occupied units	2.2

JOHN J. UHL
ADMINISTRATOR
COASTAL ZONE
MANAGEMENT PROGRAM

May 18, 1993

Mr. Thomas A. Sands
4500 One Shell Square
New Orleans, LA 70139

RE: JP-93-02, P921140; Coastal Use Permit Application
Estelle Plantation Partnership
Construction and maintenance of a
public golf course. Also, construction
of streets and other appurtenant
structures for residential and commercial
development surrounding the golf course.
Sections, 7, 82, 85, & 89, T14S-R23E
Jefferson Parish, LA

Dear Mr. Sands:

In accordance with the Jefferson Parish Coastal Zone Management Program's Procedures and Authorities to Regulate Uses of Coastal Concern in Jefferson Parish, Part E.2 (La. R.S. 49:214.34.A.1 & 2), activities occurring wholly within a fastland do not generally require a permit since there is normally no direct and significant impact on coastal waters. However, if a proposed use will result in discharges into coastal waters, or significantly change existing water flow into coastal waters, a Coastal Use Permit may be required.

Jefferson Parish is concerned that, due to the large size of the proposed project, the stormwater runoff from the golf course and associated residential and commercial development may have a significant impact on coastal waters.

Therefore, to ensure there will be no direct and significant impact on the Coastal Waters of Jefferson Parish, we request the applicant agree to comply with that condition detailed on the attached plat. The applicant's acceptance of this condition, by signing where indicated, will ensure that present and future operations of any and all activities associated with the proposed use will have no significant impact on coastal waters; thereby qualifying the referenced activity for a fastland determination.

If you have any questions or require further information, please contact Foster Voelker at (504) 838-4230.

Sincerely,

John Uhl

Estelle Plantation Partnership

To the maximum extent practical, the applicant shall ensure that any and all stormwater discharges resulting from the proposed activity will not significantly impact coastal waters of Jefferson Parish. To this end, the use of golf course lakes as retention ponds shall be planned, sited, designed, constructed, operated, and maintained to avoid, to the maximum extent practical, significant impacts on coastal waters resulting from the construction of the golf course and all associated commercial and residential development.

The applicant does hereby agree to comply with the foregoing condition; and requests that this sheet be included in the plats and thereby be a part of the official application.

May 16, 1996

Dear Mr. Carrere:

Based on existing levels of lot demand on the Westbank of Jefferson Parish, current lot prices and current subdivision development costs, we have conducted a financial feasibility analysis of the Estelle Plantation golf community. The existing rate of market need for residential lots would warrant the provision of at least four lots per month not on a golf course and two lots per month on the course. The current market absorption rate (demand) of six lots per month is likely to grow over the next several years as employment in West Jefferson expands.

Based on a modest growth in demand from 72 lots in mid-1998 to a peak demand of 96 lots per year by 2003, the proposed golf community would be very successful. The average rate of lot sales over its nine years of sales would be 77 lots per year. The Charles Lassar study of the project, based on a totally different methodology, forecast a long term demand of 76 lots per year. Historically, the other major golf course communities in Jefferson, the Eastbank of St. Charles and Western St. Tammany have achieved lot sales rates of 84 per year. The project, based on the market demand currently present and current development costs, is financially feasible.

We have also sought to estimate the minimum market lot demand necessary to warrant land development under your proposed land use plan. Our analysis produces a financial breakeven with a 15% rate of return on the land investment and a 10% developer profit at an average lot absorption rate of 55 lots per year. A long term demand of less than five lot sales per month is barely faster than the typical Westbank subdivision without a golf course.

The combination of a public golf course with a modestly priced residential community produces a unique match to market needs.

The golf course will be able to offer green fees at a level far below private courses because it does not have to recover land costs or street access costs. This is only possible because of a land donation by Estelle Plantation to Jefferson Parish. Simultaneously, the creation of a golf course created an amenity for the remaining Estelle acreage which enhances its price in the marketplace without imposing the cost of building the golf course. The Estelle Plantation residential community can afford to sell unusually large lots for prices lower than normally available in a golf course community in the New Orleans area. The break-even level of market demand becomes a modest five lots per month. The total sellout time of 13.7 years is still similar to the historical average of about 13 years for other similar projects in the New Orleans area.

Mr. Tac Carrere
May 16, 1996
Page Two

This beneficial outcome for the public is only possible through the joint development of a public course with a residential community. Separate development of a 200 acre municipal course with substantial green space at today's Westbank residential land costs of about \$16,000 per acre would impose an over \$3 million additional cost on the public golf course.

We will be available to meet with you and other property owners at your convenience to discuss our conclusions.

Sincerely,

Wade R. Ragas, PhD, MAI

Marshall Valuation - Street Costs	Addendum A
-----------------------------------	------------

PURPOSE OF THE ANALYSIS

The purpose of this report is to test the Highest and Best Use of the subject by estimating the Investment Value of the subject property if it were developed into a planned golf course community. This analysis is not an appraisal report or to be considered in any form an indication of market value to a typical purchaser. The purpose of this report is to test the financial feasibility of the proposed community and establish the minimum level of market demand necessary for there to be a "market need".

Feasibility is defined by the Dictionary of Real Estate Appraisal published by the American Institute of Real Estate Appraisers as "An indication that a project has a reasonable likelihood of satisfying explicit objectives". Or to apply to the subject of this analysis, is there enough demand at anticipated lot prices and development costs to create a reasonable return to allow the property owner to develop the site. The subject's feasibility was studied using previous studies of sales patterns of golf course communities, lot sales activities of currently active Jefferson Parish subdivisions, development cost on other subdivisions in the Barataria Corridor and preliminary plans for the community.

If it is determined that the project is financially feasible, then there is a market need for the project as tested. The project as tested in this analysis involves an integrated project containing a municipal golf course with an additional 303 acres of single family homes adjoining the course fairways. The community as tested requires the construction of the integrated course throughout the community.

THE PROCESS OF ANALYSIS

The process, as presented herein, contains an analysis of all the ingredients in the development of the subject site as proposed by the current property owners. Development costs, lot sales, general overhead and debt structure are considered to determine the Investment Value of the subject site. Two analyses are presented using similar formats. The first analysis considers reasonable expectations for the project as concluded by the author's research of average income and golf course communities. The second analysis uses the same assumptions contained in the first, except the rate of lot sales are lowered to determine the approximate point when the Investment Value equals the estimated current market value of the site. This is the minimum lot absorption rate necessary for there to be a market need for the project.

ASSUMPTION AND LIMITING CONDITIONS

1. Information, estimates, and opinions furnished to the authors and contained in the report were obtained from sources considered reliable and believed to be true and correct. The acreage contained in the golf course area, street right-of-ways, and under lots have been estimated by authors using preliminary drawings performed by Richard Lambert, P.E. However, no responsibility for accuracy of such items furnished the authors can be assumed by the authors.
2. No responsibility is assumed for legal matters. The authors are not required to give testimony or appear to court because of having made the report with reference to the property in question, unless arrangements have been made previously.
3. The author assumes that there are no hidden or unapparent conditions of the property, subsoil or structures which would render it more or less valuable. The appraiser assumes no responsibility for such conditions, or for engineering which might be required to discover such factors. The author further assumes no responsibility for political, social, or economic changes which would have an affect on real estate values after the date of this valuation.
4. The authors have relied upon the land plan provided as noted. Changes in the number of lots or configuration of the community could impact the analysis contained in this study.
5. The fee for the investigation and preparation of this report is not in any way contingent upon the conclusions herein reported, nor contingent upon anything other than the delivery of this report. The fee for making this report does not include any court testimony of pretrial conferences.

CERTIFICATION OF AUTHORS

The undersigned does hereby certify that, except as otherwise noted in this appraisal report:

1. I have no present or contemplated future interest in the real estate that is the subject of this report.
2. I have no personal interest or bias with respect to the subject matter of this report or the parties involved.
3. My compensation is not contingent on any action or evident resulting from the analysis, opinions or conclusions in, or the use of, this report.
4. To the best of my knowledge and belief, the statements of fact contained in this report, upon which the analyses, opinions, and conclusions expressed herein are based, are true and correct.
5. This report sets forth all of the limiting conditions (imposed by the terms of my assignment or by the undersigned) affecting the analyses, opinions, and conclusions contained in this report.
6. This appraisal report has been made in conformity with the Uniform Standards of Professional Appraisal Practice and is subject to the reporting requirements of the Appraisal Institute.
7. No one other than the undersigned prepared, or contributed significantly to, the analyses, conclusions, and opinions concerning the real estate that are set forth in this appraisal report.
8. I have made a personal inspection of the property that is the subject of this report.
9. The analyses, opinions and conclusions were developed, and this report was prepared, in conformity with the Uniform Standards of Professional Appraisal Practice ("USPAP"), except that the Departure Provision of the USPAP does not apply.
10. Compensation is not contingent upon the reporting of predetermined value or direction in value that favors the cause of the client, the amount of the value estimate, the attainment of a stipulated result, or the occurrence of a subsequent event.
11. This assignment was not based on a requested minimum valuation, a specific valuation, or conclusion.

Valuation Assignments

Wide range of property types including apartments, bank branches, churches, office buildings, retail properties, single-family homes, subdivisions, tank farms, vacant parcels, and warehouse properties. Assignments have included opinions of market value, market feasibilities analysis, and investment analysis. Clients include law firms, commercial banks, savings and loans, and RTC.

PROPOSED COMMUNITY DESCRIPTION

Location

Located on the west bank of Jefferson Parish fronting on the east side of the Lafitte-Larose Highway approximately two miles south of Barataria Boulevard (Louisiana Highway 45). A map showing the subject's location is contained on the following page. The subject neighborhood is known as the Barataria Corridor located on the "West Bank" of the Mississippi River, in Jefferson Parish. The property is located approximately nine miles southeast of the New Orleans Central Business District.

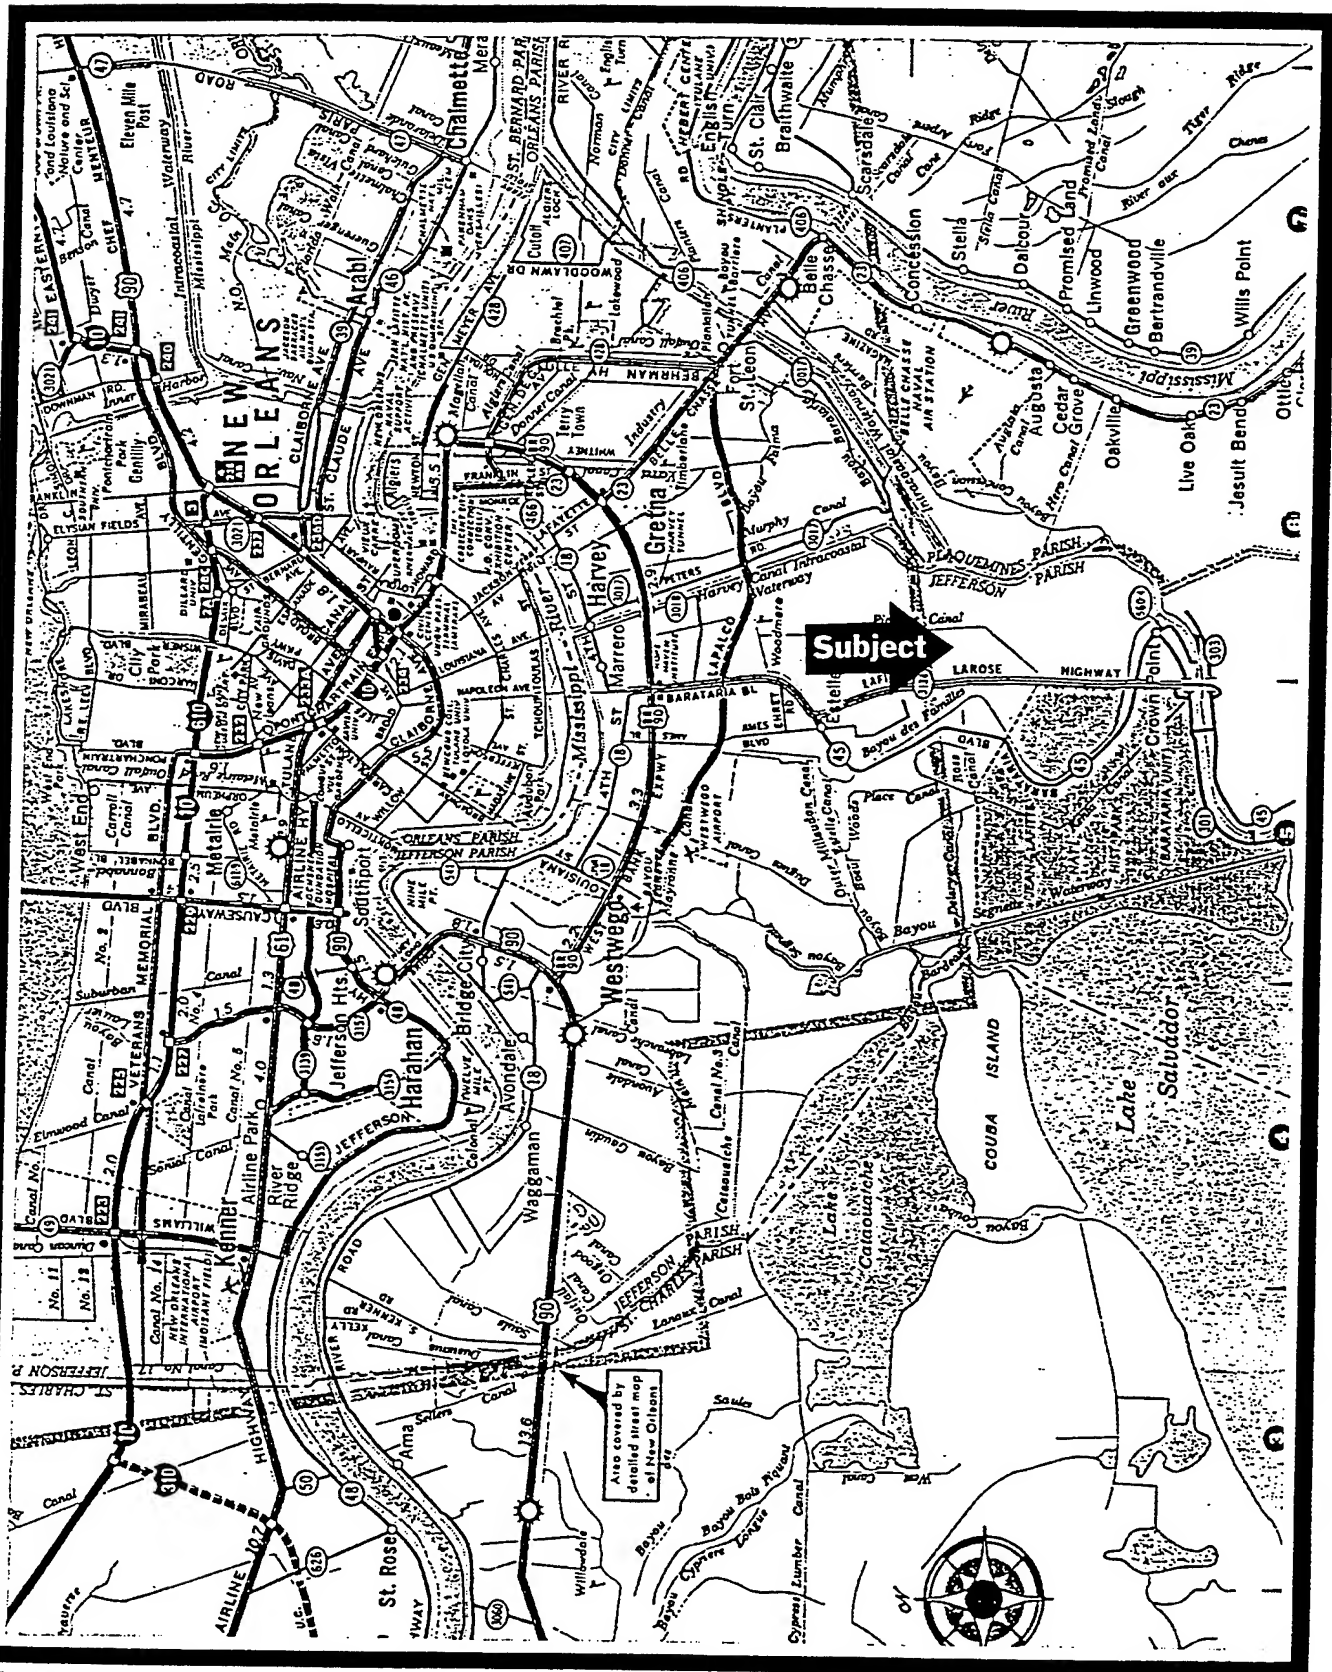

Accessibility

The primary east/west arteries in the general area of the subject neighborhood are Lapalco Boulevard and the Westbank Expressway (U.S. Highway 90), which is north of Lapalco Boulevard. Lapalco Boulevard is a four to six lane artery that connects the Belle Chasse Highway with U.S. Highway 90 (near the Huey P. Long Bridge). The Westbank Expressway has both an elevated portion and a surface level portion. The completion of the elevated portion, which traverses the West Bank from the Greater New Orleans Bridge (in Orleans Parish) to Westwood Drive, has increased east/west traffic flow and enhanced accessibility to the Central Business District of New Orleans.

The major north/south thoroughfares in the neighborhood are Lafitte-Larose Highway, Barataria and Ames Boulevards. Barataria Boulevard runs from Fourth Street near the Mississippi River southward to the town of Lafitte. The Lafitte-Larose Highway is a four lane highway which was constructed to carry traffic from Barataria Boulevard south of Lapalco to the town of Lafitte. Ames Boulevard runs from Fourth Street near the Mississippi River, intersects with Barataria Boulevard about two miles south of Lapalco and extends into a developing residential area south and east of Barataria Boulevard and west of Lafitte and Larose.

Streets, Utilities & Drainage

Lafitte-Larose Highway is an asphalt four-lane, limited access roadway. All public utilities were either available or could have been extended to the subject property. The rear of the site contains the Estelle Pumping station which has had the subject area under drainage for over 30 years.

Regional Location

PROPOSED COMMUNITY DESCRIPTION
(Continued)

Description Of Proposed Development

The planned community would be located on the east side of the Lafitte-Larose Highway just south of the Louisiana Power and Light right-of-way. The golf oriented community would encumber a total of 503 acres which includes approximately 200 acres to be donated to Jefferson Parish to construct a municipal golf course. The remaining 303 acres (estimated by the authors) would be developed into 748 single-family home sites and street access. These estimates are based on preliminary plans performed by Richard C. Lambert, P.E. An estimate of the amount of streets by the authors indicates 46,435 linear feet of streets or an average of 62.07 linear feet per lot. The community has both adequate water and sewage lines available along the Lafitte-Larose right-of-way. A copy of the preliminary plan by Richard C. Lambert is contained on the following page.

NOT FOR FINAL USE

THE PLAN IS CONFIDENTIAL IN NATURE AND SHOULD NOT BE RELIED UPON AS A DETERMINATIVE STATEMENT OF THE MEASUREMENTS FOR POTENTIAL DEVELOPMENT OF THE PROPERTY. ALL DETERMINATIONS ARE APPROXIMATE.

CONCEPTUAL PLAN

1 LIT-4
100-1-75000-00

Development Costs

To develop the community concrete streets, fill and fencing are required. In Addendum A street development costs are presented for the project. The street costs have been estimated using Marshall Valuation Service. The street costs were calculated to be \$243 per linear foot. According to Bruce Layburn of JBL Homes, the developer of Debattista Place and Ridgecrest subdivisions, the typical street cost has been between \$240 and \$280 per linear foot for small one or two street subdivisions. These costs are also consistent with those experienced by Sunrise Homes at the Shadowlake Subdivisions.

The fill costs are estimated to be \$4.50 per cubic yard, which is considered typical for a project of this size and is supported as being reasonable by Richard Lambert, P.E. and other developers in the area. An engineering analysis by the engineering firm of Krebs, LaSalle and LeMieux prepared for a project near the subject site (Zaslow Tract located 1 mile south of the subject site) supports these cost estimates for both street and fill costs. They were also accepted by Judge Tienmann of the 24th Judicial District in his opinion of the Zaslow Case.

A copy of the development cost by phase is contained on the following page which is followed by the total development cost for the entire project. The land cost shown on the following page is based on a 1991 valuation upheld by the Parish Court on a site south of the subject community of \$12,000 per acre and on expert reports performed by Real Property and Richard Brewster, MAI on sites located west of the subject as of 1996 for \$16,000 per acre. This is not an indication of the subject's value, but an estimate for the feasibility of the subject development. It is likely that the market value of the subject site (if available for development) is substantially higher under the proposed development plan.

Street Cost

The exact lots to be absorbed for each phase have not been calculated due to the preliminary nature of the information available. Instead, typical per lot cost analysis has been used for each phase of development. A total of 46,425 linear feet has been scaled by the author which indicates an average of 62.07 linear feet of street per lot. This is higher than typical given the irregularly shaped lots and golf course plan. The average amount of street required per lot was multiplied by the number of lots in each phase to indicate the total amount of streets required for each phase.

Fill Cost

An exact estimate of the fill required for the subject community is unknown. An allowance of 1.5 feet of fill, or an allowance of \$11,000 per acre was applied to the area not contained under the Golf Course. The required top of slab elevation is likely to only be +1.5 MSL (mean sea level) for sites within the Westbank Hurricane Protection Levee. To determine the amount of fill required for each phase the total 303.85 acres have been divided by the 748 lots estimated in the community to calculate an average area to be filled per lot of 17,695 square feet including associated street right-of-way. Multiplying this average fill area per lot times the number of lots in each phase indicates the acreage to be filled by phase.

Development Costs By Phase

Phase I - 125 Lots

Planning			\$90,000
Gate & Guardhouse	\$15,000	2	\$15,000
Fill (Per Acre)	\$11,000	50.78	\$558,580
Street Costs (Linear Foot)	\$245	7,759	\$1,900,955

Engineering (3% Of Costs In Phase)			\$91,669
Total Costs			\$3,147,318

Total Development Cost (Rounded)	\$17,597,000
Land Cost (Rounded)	\$4,848,000
Land & Development Cost (Rounded)	\$22,445,000

* Street costs totals included allowances for inflation over the life of project.

Financing

Loan Terms

The analysts have inquired as to the possible financing for the proposed subdivision. A rate of 10% is market rate with up to a two point fee for planning and the development of the first phase of the community. A 70% loan to value of the cost of the first phase is used with all future other phases being financed by equity cash flows from the project. A conservative loan partial release rate of 1.3 times per lot for the first two phases (250 lots) is used in this analysis. The author has assumed nine months of planning and nine months of construction on the first phase of the development. Table 2 on the following page presents the loan and financing terms for the first phase of construction.

Partial Release Assumptions

Total Number of Lots (First 2 Phases) *	250
Rate of Annual Lot Appreciation	5%
Loan Partial Release Rate	1.3
Min. Loan Repay Per Lot *	\$9,392
Average Loan Per Lot *	\$7,224

* Based on the first 2 phases only.

Lot Description

The preliminary plans of the community call for approximately three basic lot sizes ranging from 10,000 to 20,000 square feet with an approximate average of 14,000 square feet. For the purposes of this analysis no variation on lot size was considered, given the preliminary nature of the plans. According to these preliminary plans of the 748 home sites, 52% or 389 have golf course frontage.

Lot Pricing

Based on a previous analysis performed by Real Property, Barkley Estates lots had an average sales price of over \$3.80 per square foot or over \$40,000 per lot. Barkley Estates is a new community located on the north side of Lapalco Boulevard half a mile east of Barataria Boulevard. Extracted land value from improved lots in Bent Tree Subdivision just north of Estelle Plantation had per square foot land values of \$3.76. Ridgecrest Subdivision just west of Bent Tree near the intersection of Barataria and Lafitte-Larose Highway had extracted per unit land values of over \$4.00 per square foot for average income housing. The authors have estimated that the average future retail value for the subject lots should be approximately \$45,000 for interior non golf course lots (or \$3.21 per square foot) and \$55,000 for golf course lots (or \$3.93 per square foot) once lots sales begin at the end of 1997. The average retail lot prices are estimated to increase by 5% per year over the sellout period once sales begin.

Absorption

Absorption was estimated using a previous analysis performed by Real Property for Estelle Plantation on competing subdivisions and historic sales rates of golf course communities. The analysis of lots sales revealed that Barkley Estates had been averaging approximately 10 sales per quarter. However, when the last four months of 1995 are considered, an average of 8.25 sales per month took place which is the equivalent of 24.75 sales per quarter.

Southlake Village located in Kenner has been on line since August 1994. It had achieved 22 sales by year end 1994 which is approximately 4.4 sales per month. Woodlands, located in Belle Chasse, has been selling lots since the Fall of 1993. It has received an average 8.4 sales per quarter. Analysis we previously submitted of 11 average to above average income subdivisions on the Westbank of Jefferson, Orleans and Plaquemines supports a current lot absorption rate of 4 per month or 12 per quarter.

The subject community, like other communities, are estimated to have a number of pre-sells during development. The demand in other communities studied supports an average quarterly absorption of 6 lots per quarter of golf course lots and 12 lots per quarter of non golf course lots with some increases in absorption as the community develops. The initial rate of sales of 18 per quarter or 72 per year is slower than the historic absorption of golf course communities in New Orleans MSA from 1970 to 1985. Near the end of the development the non golf course lots will sell out before the golf course lots causing an increase in the rate of golf course lot sales. A table on the following page outlines the anticipated absorption (lot sales) and revenues from lot sales. The absorption pattern as outlined is considered to be a conservative estimate of lot absorption, but is adequate to prove the feasibility of this development.

Lots Sales & Revenue

Quarter	Cumulative Lot Sales			Lot Sales		Lot Sales Prices		Revenue From Sales	
	Golf Lot Sales To Date	Non Golf Lot Sales To Date	Total Lot Sales To Date	Golf Lot Sales Quarter	Non Golf Lot Sales Quarter	Golf Lot Prices	Non Golf Lot Prices	Golf Lot Revenue	Non Golf Lot Revenue

SUMMARY OF CASH FLOWS

The following page outlines a summary of cash flows resulting from the development of the subject property.

Revenue

The first column after the quarter is the lot sales revenue column. This is the summation of the revenue from the previous table presented on lot sales and revenue by quarter.

Expenses

Selling and Marketing

Costs of sales include sales commission for the selling agent. Local realtors' commissions on lot sales generally range from 5% to 6%. For this analysis an overall average of 5% is considered to be appropriate. Marketing costs and advertising are included by the real estate brokerage within this fee.

Developer Fee

The developer is assumed to collect 10% of gross sales as they occurred as profit for overseeing the project.

Property Taxes

Property taxes are based on the current value of the subject property divided by the number of lots in the subdivision with an estimated allowance for the increased assessment on finished lots. The property taxes are then reduced as lots are absorbed by purchasers.

Overhead

Overhead is the cost of maintaining an office for the purpose of handling and overseeing the sales and construction of the development. An allowance of 10% of sales is estimated for their costs. Insurance, general operating costs and miscellaneous expenses are included in the 10% allowance.

* Development Cost Funded By Equity Only

Net Income To Land

The difference between the Revenue and Expenses is usually referred to as Land Income. This is the income to the investor before debt service. The only debt on the property is the single loan for the first phase development.

Debt Service

The debt service is for a single loan for the first phase development cost which is paid off early in the development cycle of the property.

Net Earnings On Investment

Presented are both the cash flow to equity and the cumulative cash flow to equity. This is the profit to the investor after debt service and all expenses. It is net of the land value of \$16,000 per acre.

Conclusions Of Analysis

Cumulative Equity Cashflow	\$12,024,627
Cumulative Subdivision Costs	\$38,280,121
Authorized Loan	\$1,806,100
Equity Contribution	(\$4,848,000)
Gross Sellout	\$46,532,947
Years To Sellout After Initial Streets	9.75

Investment Value of Land Equity	\$5,468,000
15% Before Tax Rate of Return	
Investment Value Per Acre	\$18,046
Assumed Initial Land Value	\$16,000

MINIMUM DEMAND REQUIRED

Using the previous (most probable) analysis presented on the prior pages, demand for lot sales have been lowered to estimate the minimum demand required to make the development feasible and produce an investment value equal to the estimated \$16,000 per acre land value concluded on other sites in close proximity to the subject as of 1996. In the minimum lot sales analysis all of the same assumptions from the most probable analysis are used, except for the rate of lot sales, timing of the phases and the life of the project. The slower rate of sales require the lots sales to continue further into the future and suggest that the future phases of streets of the development would be constructed at a slower rate compatible with the adjusted rate of sales.

On the following three pages are tables for Lot Sales & Revenue, Summary of Cash Flows and Conclusions. The table on the following page shows the slower rate of lot sales used. Once the lot sales were lowered by six less lot sales per quarter, the "break even" was located where the investment value equals the original estimated land value of \$16,000 per acre as seen on the last page of tables. The total sellout is now estimated to take nearly 14 years once the first phase of streets are installed, while the previous analysis indicated less than 10 years to sellout all of the lots. The average annual rate of lot sales required to make the project feasible is 54 lots, which is significantly lower than the 94 lots concluded in the most probable analysis presented earlier in this document. This is also well below Robert Charles Lesser & Co.'s estimates of 76 lots per year for the subject property in an analysis prepared in 1994. It is also less than the 84 lots per year historically achieved by golf course communities in the New Orleans area. The market need for the project is clearly evident. Not even five lot sales per month are needed for this project to be financially feasible.

This is only possible because the land owner would contribute 200 acres for public use as a golf course. In return, public funds would be used to construct the course which enhances the lot prices in the community. These two land uses are only possible at such modest lot prices and low golf course fees when they are combined in the manner proposed for the Estelle Plantation property.

Mr. Tac Carrere
16th Floor, Heritage Center
111 Veterans Blvd., Suite 1600
Metairie, Louisiana 70005

Dear Mr. Carrere:

Enclosed are a set of factual information which may be useful in your pending 404 permit application with the Army Corps of Engineers. The initial information includes:

1. Historic demand and pricing for golf course communities in the New Orleans area.
2. Recent lot absorption rates for 11 subdivisions near the Estelle Plantation parcel.
3. A history of appraiser opinions of market value and highest and best use for parcels near the Estelle parcel.
4. Current golf course fees at public courses vs. private course fees in the New Orleans area.

Historic Demand

The historic lot absorption rate from 1970 to 1985 was a very consistent 85 lots per year per golf course community. I have actually searched the public record and plotted the location of every lot sale in six communities over this time period—a total of over 4500 lot sales. These sales are summarized by table in the report, but can be factually supported by computer files. Historically there were five golf course communities each year under development with on going sales programs from 1975 to 1985. Today there are only two golf course communities offering newly developed lots, both of which are oriented toward the most affluent households in the market (a very small market segment). Instead the traditional above average to average income market served by Chateau Estates, Ormond, Lake Timberlane, Country Club Estates, Eden Isles and Eastover are not presently being served. The lack of any vacant parcels of even 100 acres zoned for residential use in East Jefferson precludes any future golf course development in the northern portion of Jefferson Parish.

The recovery of the oil and gas industry along the Gulf coast due to 3D seismic technological advances and directional drilling will enhance employment in the southern portion of Jefferson (West Jefferson). While a return to the rapid job growth of the 1975-1985 period may not occur it is likely much stronger employment growth will occur than in 1997-2000 than from 1991 to 1994. I have not prepared a forecast of

employment growth however existing published forecast by the Univerisity of New Orleans Division of Business and Economic Research indicate relatively slow growth in employment for 1996 followed by stronger employment gains in 1997. These expectations are consistent with the large expansions in exploration budgets of major oil firms for projects in the Gulf of Mexico. It is also consistent with surge in construction of deep water drilling rigs to support exploration in water depths of 3,000 feet.

Golf Course Lot Prices

Lot prices on the golf course are usually 20% to 40% higher than lots not on the course. The lots not on the course sell for prices similar to non-golf course communities appealing to above average income buyers. In todays market this would be \$42,000 to \$50,000 lots for locations not on a golf course based on actual sales of lots in better quality subdivisions. Golf course lot prices of \$55,000 would not be high in a market with luxury house purchasers in Old Metairie are tearing down \$180,000 houses for the lot or where golf course lots in English Turn sell for more than \$100,000. Typically, two-thirds of the lot sales are for the lots not on the course and one-third or so are for golf course lots.

Actual Lot Absorption

The recent lot absorption rates on the westbank of Jefferson, Orleans and Plaquemines parishes have been 3-4 lot sales per development per month. There is no large scale inventory of vacant, unsold lots in any of these developments. The westbank market as a whole, excluding English Turn, has been absorbing between 35 and 40 lots per month for the past two years. Most of these 11 subdivisions are sold out with five currently selling lots. A lot absorption rate for lots not on a golf course of 4 lots per month would be consistent with current market conditions. Sales of golf course lots would be in addition to these lots since they draw from demand that is now buying at English Turn or Oak Harbor or Old Metairie or the Jefferson Lakefront or Mandeville. I will analyze the lot sales activity at Lake Timberlane and Stonebridge but have not done so in the short time period available since I was asked to comment (under two weeks).

Non-Wetland Parcels Near the Subject

The wetland parcel estimates prepared by the U.S. Army Corp of Engineers for the westbank of Jefferson, Orleans and Plaquemines are included herein. They show under 650 acres of residentially zoned land available in the Barataria Corridor as of 1991 with a non-wetland status. I have reviewed their maps and parcel locations. In my opinion there is not another site with adequate land area, location, or egress which can be assembled for a golf course community on the westbank of Orleans or Jefferson Parishes within the identified non-wetland parcels.

Highest and Best Use Opinions of Appraisers for Similar Parcels

I have reviewed the appraisal opinions of seven other MAI appraisers of parcels they analyzed within three miles of the subject between 1979 and 1996. Uniformly they found parcels within the hurricane protection levee to have a highest and best use for residential development (either immediately or in the near future). In several instances detailed discounted cash flow studies were prepared which showed development with current (1996) cost to be feasible. These appraisals are identified within this report but copies of all of them is too extensive a document to submit. All of the reports have been prepared for either private owners for use in court or for one of two public agencies (National Park Service or West Jefferson Levee District). Their conclusions today are similar to the U.S. Army Corps of Engineers conclusion in the Environmental Impact statement for the Westbank Hurricane Protection Levee (pp.5-15) from 1984:

"Approximately 3,640 acres would be enclosed, the largest area of any of the alternatives. This would induce extensive development throughout areas currently classified as wetlands. The Marrero-Estelle corridor has been a highly desirable development area because of its proximity to major employment and activity centers in the New Orleans SMSA. There is a need for moderately priced land to provide housing for low to middle-income buyers and renters. There are few other such areas available in the area."

Golf Course Fees

A review of current golf course fees is also presented although I am still verifying some of those fees. Green and cart fees for public course tend to be \$35 or so at public courses depending on the quality of the course. Private courses, if they allow non-members to play, tend to have green fee and cart rentals which total \$60 or more per round played. There are no municipal golf courses in Jefferson Parish. By national standards it is extraordinary for a county with a population of over 450,000 persons to not have any municipal golf courses. I have done studies of golf course demand in the past in Jefferson, but have not prepared a study of demand at this time for the Estelle course. I would expect a study grounded on factual market information to find a substantial and adequate demand exists for a municipal golf course in Jefferson Parish with more affordable green fees for the public which did not require an additional country club membership fee in order to be allowed to play.

I hope that this factual information proves to be useful

Sincerely,

Wade R. Ragas, PhD, MAI

Valuation Assignments

Wide range of property types including office buildings, subdivisions, hotels, Miss. River batture, golf courses, vacant tracts and mixed use developments, manufacturing facilities, trailer parks, multifamily housing, condominiums, timeshares, houses, warehouses. Assignments have included opinions of market value, market feasibility analysis, reviewer of appraisals and investment analyses. Clients include law firms, domestic and foreign commercial banks, savings and loans, RTC, FDIC, Gulf Oil, Purina Mills, Southern Pacific Railroad and various property owners.

Expert witness for FDIC and RTC for large commercial loan litigation in ten states from 1989 to 1995 covering over \$500 million in loans (five groups of litigation).

Expert witness on valuations, geographic market analysis, S&L Board of Director responsibilities, going concern business valuation

Market analyses for residential and multifamily mortgage backed bonds totalling over \$400 million (six issues).

Valuation Experience: 15 years

v

SUMMARY OF CREDENTIALS (Continued)
Wade R. Ragas PhD, MAI

Typical Appraisal Assignments in the past two years:

Large Tracts of Land for Mixed Use Development: St. Tammany (2), Jefferson (4)
Neighborhood Externality Study covering 900 houses, Jefferson
Batture Land Sites: Jefferson, Orleans, Plaquemines (oil terminal)
Market study for Jeff. Home Mortgage Authority
Commercial lots
1840 plantation and 13 modern houses
Condominium conversion in French Quarter
Three building apartment complex
Industrial Plant in W. Baton Rouge
Reviews of 12 commercial loans and appraisals
Earnings loss of an individual

CERTIFICATION

I certify that, to the best of my knowledge and belief, unless as otherwise noted in the appraisal report:

- The statements of fact contained in this report are true and correct.
- The reported analysis, opinions, and conclusion are limited only by the reported assumptions and limiting conditions, and are my personal unbiased professional analysis, opinions and conclusions.
- I have no present or prospective interest in the property that is the subject of this appraisal report and I have no personal interest or bias with respect to the parties involved.
- My compensation is not contingent on an action or event resulting from the analysis, opinions, or conclusions in or the use of, this report.
- I am currently certified under the continuing education program of the Appraisal Institute.

Louisiana General Certified
Appraiser No. 0043

ASSUMPTIONS AND LIMITING CONDITIONS

This report is subject to the following assumptions and limiting conditions (imposed by the terms of my assignment or by the undersigned) affecting the analyses, opinions and conclusions contained in this report.

1. No responsibility is here assumed for any matters which are legal or political, social, or economic changed conditions which could have an effect on real estate values which changes take place after the effective date of the opinion.
2. To the best of my knowledge and belief the statements of fact contained in this report, upon which the analyses, opinions and conclusions expressed herein are based, are true and correct.
3. The Analyst is not required to give testimony or appear in court because of having issued this report with reference to the property in question unless arrangements have previously been made therefore.
5. That no opinion as to title is rendered.

HISTORIC GOLF COMMUNITY ANALYSIS

It is difficult to analyze the existing level of demand for golf course community lots in the New Orleans area without some historic perspective. I have prepared a 12 year history from 1974 to 1986 which documents "normal" demand conditions when both employment and population were growing in the New Orleans area. From 1987 to 1990 population declined in Orleans and Jefferson, which led to a marked reduction in demand for golf course lots. Recovery in lot demand began in 1990 with a 5% rise in raw land values for parcels suitable for development occurring in the Barataria Corridor. This increase in land values can be documented (if necessary) from actual market transactions.

From 1992 to 1994 the inventory of finished lots in developer or lender hands was cleared from the market. In St. Tammany, the need for new lots became evident in 1992 and a year or so later in Jefferson. Starting in 1993, new streets began to be created for single family subdivisions on the Westbank of Jefferson and Orleans Parishes.

Golf course lots at English Turn began to rapidly sell in 1993. New phases have begun annually since 1993 at English Turn. A large scale program of new street construction for English Turn is in the final design stages at Krebs, LaSalle and LeMieux (engineers) at this time. Enclosed are recent announcements of lot availability at English Turn. (See Addendum A.)

The Eastover golf community is now seeking a buyer to resume development around the golf course. This site in Eastern New Orleans has been in the midst of the largest supply of finished lots in the New Orleans market. Even here efforts to start new development are underway. (See Addendum A.)

Oak Harbor in Slidell was delayed from lot sales and street development from 1988 to 1994. The sale of the west side of the property to several developers in 1994 has allowed construction to resume. A review of real estate transfers shows a very strong housing market with luxury oriented market demand.

Typically, the New Orleans area could simultaneously support five golf course communities with differing geographic and market appeals. Today only two golf communities are actively being marketed - English Turn and Oak Harbor. Although Jefferson Parish has the strongest economy in the region and the largest job growth in the New Orleans area, it has no large scale residential community currently under development.

A severe land shortage in East Jefferson precludes large scale development in the future. West Jefferson has almost no parcels of even 100 acres suitably located for development which do not require a 404 wetlands permit.

Historically, the golf community market could absorb 435 lots per year or about 87 per golf community. When there are only three golf communities competing instead of five, a much smaller total market of 255 or so lots would be needed for each one to average 85 lot sales per year or 21 per quarter. The breakeven sales volume for a golf course community is much lower than 85 lot sales per year. Depending on development costs and the lack of cost for the golf course to the developer, it is my belief that an adequate market rate of return for a developer can be attained between 50 and 60 lot sales per year.

First Time Lot Sales

Lot sales within six golf course oriented residential developments were analyzed between 1974 and 1986. Lot sales by the original developer of the golf course community to individuals or builders were traced in the public records using a data service called New Orleans Real Estate Transfers. This "legal news" has proven to be a generally reliable listing of the publicly recorded sales. It provides the parcel lot and square, street address, buyer, seller, recordation citation, sales price and lot dimensions.

The first time lot sales are indicative of the absorption by the market place comprised of individual buyers from the development. Not included on these tables are acreage sales to other developers who would themselves subdivide, pave, and sell individual lots within the larger country club development.

Typically, only a few lots are recorded in the first few months of sales during the first year of a new project. Most of the developers experience at some point a two or three year surge in lot sales during which they sold 57% to 70% of all lots in the current phase of the development.

The table below summarizes the sales activity by year for the six developments analyzed. A total of 4,655 lots were sold by the developers to individual buyers between 1974 and 1986. During the average year 438 lots were sold. The average golf course development sold about 84 lots per year - twenty-one lots on the course and sixty-three lots off the course.

However, there was substantial variability in the rate of lot sales. Chateau Estates and Ormond both achieved high rates of sales, in excess of 125 lots per year. Stonebridge achieved high rates of lot sales in 1981 and 1982 (over 223 lots per year). It was on the Westbank adjacent to the Barataria Corridor and the large job concentration at the Harvey Canal.

Source: New Orleans Real Estate Transfers tabulated by Real Property Assoc., Inc.

Beau Chene maintained a steady but much slower rate of sales averaging 46 lots per year over a 15 year period. This upper income oriented development was over 28 miles from the employment concentrations of East Jefferson and over 35 miles from the New Orleans CBD. Very exclusive, upper income projects appear to achieve a long term steady demand rather than the sudden surge in demand for average income oriented housing. Somewhat less expensive, but still above average income golf communities had stronger overall demand prior to 1986.

Belle Terre was also about 15 miles from the New Orleans International Airport and 20 miles from Elmwood - both large areas of job concentration in East Jefferson. It was more than 25 miles from the New Orleans CBD. Belle Terre sold 78 lots per year between 1974 and 1978. This sales rate is deceptive. Simultaneously four other subdivisions were being marketed at Belle Terre which were not part of the golf course community. Just three of the five averaged 157 lots per year from 1974 to 1978.

Finally, Willow Wood was over 15 miles from the Harvey Canal, and its nearest source of employment concentration was Avondale Shipyards. The shipyard was dominated by blue collar, hourly employees who were unlikely to seek a golf course oriented housing development. The engineering and professional staff of this 6,000 person employer offered Willow Wood a potential market. These same workers were also about an equal distance from Stonebridge or Chateau Estates as from Willow Wood. It was accessible only through a two lane, unlighted road across a low lying wooded area. It never successfully appealed to the marketplace.

A golfing and country club housing development with good access to employment could reasonably expect to average at least 80 lot sales per year based on the historic sales rates of golf course communities during periods of economic expansion of the New Orleans area. There would be some years below this rate and some above. It would not be unusual to achieve a peak sales period at double this rate for several years. The actual average sales per year from 1976 to 1985 for the six active golf course communities were 21 golf view lots per year and 63 non golf view lots.

Historically, from 1974 to 1986 there had always been four or five golf oriented communities simultaneously marketing lots in the New Orleans area. This was a period of rising employment in the New Orleans market area. From 1986 to 1996 there were only two new golf communities in sales - English Turn and Oak Harbor. However, the final phase of Beau Chene was sold out during this period. Stonebridge golf course lots left unsold from the 1986-89 period were sold to a private developer who then resold all the remaining lots to end users. Eastover in New Orleans East decided not to construct the remainder of their golf course residential land and placed the remaining 79.87 acre parcel without finished lots for sale.

English Turn began offering Lake lots of .42 to .60 acres not on the golf course in May, 1995 for prices of \$118,000 to \$165,000 per lot. These lots have met with strong

market acceptance even though they lack golf course views. Only two golf courses were competing for new home buyers with newly developed lots as of April 1996 - English Turn and Oak Harbor - instead of the five projects historically in sales and development for this market. Acreage in Belle Terre with golf course frontage was sold in 1995 to a private owner by the RTC. However, no plans for developing this acreage have yet been publicly announced. Privately these owners are moving forward with plans to develop additional golf course lots, as well as other housing.

Golf Course Frontage Sites

Only a small part of the lots sold in a golfing oriented community have actual frontage on the golf course. The more successful communities (Chateau Estates and Ormond) created relatively few large sites with golf course frontage (under 20% of all lots). A similar percentage of lots (under 20%) were across the street from the course.

Together, under 40% of the lots were designed for truly upper-income housing. The majority of the sites in the typical golf course community were historically for above average income households seeking an environment superior to the typical single-family subdivision.

Beau Chene had fully half of its lots with golf course frontage and the remainder were across the street from the course lots. However, this community was oriented toward a more affluent group of buyers than either Ormond or Chateau Estates. The entire Beau Chene development sought only this small, very affluent market.

Belle Terre followed a similar strategy to Ormond and Chateau Estates, although a larger percentage of its lots had golf course frontage (27%). The overall pricing in Belle Terre was significantly less expensive than Chateau Estates or Ormond.

Acreage and Lot Sizes

The average lot square footage between 1974 and 1988 was 11,750 square feet. This is indicative of an 80 by 150 foot lot. The average lot is not indicative of the two distinct clusterings in lot sizes:

Estate lots in Beau Chene and Willow Wood of nearly 16,000 feet

Smaller, single family sites in Chateau Estates and Belle Terre of 5800 to 9600 feet

The larger sites offered a marketing advantage, but did not significantly alter the sales volume away from the two most centrally located properties - Chateau Estates and Ormond.

The same developer created Chateau Estates, Ormond, and Stonebridge. His third development, Stonebridge, had lots larger than Chateau Estates but smaller than Beau Chene or Ormond.

Comparing lots on the golf course to those not on the golf course also yields a fairly clear pattern.

The golf course lots are larger than non-golf course lots. The most successful development, Ormond, offered golf course sites averaging 15,150 sq. ft. or approximately 100'X 150' foot lots. These were one-third acre sites appropriate for houses larger than 3000 square feet of living area.

The non-golf course lots were still large at 12,000 square feet.

LOT PRICES

There was a pattern of rising average lot prices across all six golf/county club developments from 1976 to 1985. We will introduce data subsequently on lot sale prices in Stonebridge and Lake Timberlane today. However, it is useful to understand the historic pattern of golf community lot pricing. When Stonebridge opened in 1981, price appreciation no longer occurred at Willow Wood, a geographically inferior location. However, all five of the other major developments experienced rising prices from 1976 to 1985.

Although Chateau Estates and Ormond achieved more lot sales than Beau Chene, they experienced lower rates of price appreciation. In Beau Chene the average lot rose from \$22,400 in 1976 to \$65,400 in 1985, which is a 12.6% annual rate of increase.

Initially (1976), lots in Chateau Estates and Ormond were similar in price to Beau Chene - between \$20,239 and \$21,918. By 1985 both of these developments had average lot prices in the mid-\$30,000 price range. Their compound rates of price appreciation from 1976 to 1985 were:

Chateau Estates	7.3%
Ormond	5.6

These are still very substantial rates of price appreciation. Belle Terre rose from \$12,272 for the average lot in 1976 to \$30,667 in 1985 - a 10.7% rate of appreciation. Stonebridge began lot sales in 1981 with an average price of \$32,722.

Substantial variation in rates of price appreciation occurred among the six developments. Even though little price appreciation occurred in Willow Wood after 1981, the overall average annual rate of increase in price between 1976 and 1985 was still 7.1% per year. Willow Woods distant location from the market clearly has limited its market demand. It would not be a strong competitor for the lots in Estelle.

Golf course lots achieved higher sales prices and higher appreciation rates than lots without direct golf course egress. Lot appreciation rates of 7% commonly occurred and during periods of strong demand price increases of 10% per year were not unusual.

Source: New Orleans Real Estate transfers, tabulated by Real Property Assoc., Inc.

Golf course lots in Chateau Estates rose from \$32,000 in 1976 to \$73,880 in 1981. Similarly, in Beau Chene average lots selling for \$25,911 in 1976 were selling for \$70,247 by 1985. Doubling and tripling of sales prices in five to eight years produces extremely high annual rates of return.

PRICE APPRECIATION

The rate of price change is clearly not constant from year to year. An analysis of price rates of change broken into three year increments shows the unique pricing pattern from 1976 to 1985.

The average lot sales price rose 19.5% from 1976 to 1979 in the six golf course developments. This rate of growth moderated between 1979 and 1982 to a 4% rate of increase, followed by a resurgence in price increases from 1982 to 1985 of 9.6% per year.

After 1985, the oil and gas recession in Louisiana slowed the price growth rate to 3% per year. All of these rates of change are compound annual rates.

The nine years between 1976 and 1985 produced an overall compound rate of price appreciation of 9.5% per year.

When the sales are separated into those with golf course frontage and those lots without golf course frontage, the general pattern of price increase is unchanged.

However, golf course lots when viewed across all six communities grew more slowly in price, at 8% per year, than lots not on the golf course at 10.7% per year. Clearly, the amenity value of a golf course imparted even more price appreciation to the somewhat smaller, non-golf course fronting lots comprising the bulk of these developments.

The developers and investors proved to be quite rational in purchasing property in golf course communities.

Rate of Change in Average Lot Sales Prices Per Year 1976 - 1988

Time Period	All Lots
1976 - 79	19.5%
1979 - 82	4%
1982 - 85	9.6%
1976 - 85	9.5%

These were very substantial rates of price appreciation.

It is possible that average lot prices distort the price trend, since variations in the size of lots sold are commingled with pure price changes.

Lot prices per front foot are the most common unit of comparison for residential lots among appraisers in the New Orleans area. The sales price divided by the lot's front footage produces the observed prices per front foot.

After removing some of the variation due to changing lot size, even more pure price appreciation is evident. The average of all lots (see Table Thirty-two) grew by a compound annual rate of near 9.5% between 1976 and 1985.

The non-linear pattern of price increases continued to be evident. Extremely rapid price appreciation between 1976 and 1979 of 19.5% per year was followed by slower price growth from 1979 to 1982 of 4% per year. There was a resurgence of price appreciation from 1982 to 1985 of 9.6% per year.

The very large sample of lot sales (over 6,400 lots) spread across six golf communities ranging from moderate to upper-income market appeal increases the likelihood that this pattern was indicative of the market for golf course community lots.

Expected Price Appreciation

The past pattern of rapid price appreciation for all major competing developments should have been adequate to allow marketing plans based on at least 4% price appreciation per year from 1991 to 1993. From 1994 to 1995 an increase to 7% per year would be a reasonable expectation. As the project matured, higher rates of appreciation would be expected to be between 8% and 10% per year after 1995.

1976 - 85	9.8%	10.9%	9.6%

GOLF COURSE FEES

Seven public or generally open to the public courses were surveyed for current green and golf cart fees. The public courses at City Park are the best maintained and most modern of these courses. There are usually long lines of golfers waiting to play. The green fees of \$17 - \$22 and golf cart fee of \$15 are indicative of a public course fee structure for a new municipal course. The combined total fee is \$32 to \$37 per golfer per round. The cheaper fees at the other courses are consistent with the poor condition of their courses and equipment.

Private courses available for fee play were also surveyed. Their typical green fee for non-member play, if allowed, was \$55 plus a golf cart fee of \$10 to \$20. The combined total was typically \$65 or more for a well maintained course. These courses generally did not seek non-member play except for the far outlying locations such as Willowdale, Belle Terre and Oak Harbor.

Jefferson Parish is the second most populous parish in the State of Louisiana. Nationally, it is extraordinary for a county with over 450,000 persons and a relatively affluent population to not have even one municipal golf course.

**AVAILABLE NON-WETLAND PARCELS
WESTBANK OF JEFFERSON AND ORLEANS PARISHES**

In open public court testimony Mr. Irv Eppling, MAI, as an expert witness regarding litigation between the West Jefferson Levee District versus Dr. & Mrs. Zaslow in the Twenty-fourth Judicial District in January of 1996, presented a large map he had secured from the U.S. Army Corps of Engineers. This colorized map (enclosed) was dated from 1991. It showed in yellow areas which were likely to be considered jurisdictional wetlands. Areas colored blue were locations which were not expected to be classified as jurisdictional wetlands.

Subsequently, in two separate sworn depositions Dr. Buddy Baehr of the U.S. Army Corps of Engineers discussed each non-wetland parcel identified on the map (Zaslow case and K-2 et al). I have further examined that testimony along with a tabular presentation which identifies the approximate acreage in each parcel (Tables 13 to 16). Also shown are development restraints based on my judgement, physical inspection in some cases and Dr. Baehr's deposition testimony.

Altogether the 1991 map identifies 5,285 acres of non-jurisdictional wetlands on the Westbank of Orleans and Jefferson Parishes as well as land in Plaquemines near Belle Chase. (See Table 13.) Parcels larger than 200 acres account for nine parcels of 3,690 acres. Parcels near the subject within the Barataria Corridor (Manhattan to Bayou Sequette, Lapalco to Bayou Barataria) account for 924.6 acres in 17 parcels. Within the Barataria Corridor there are 621.6 acres of residentially zoned land and 303 acres of industrial or commercially zoned land.

Table Thirteen

TOTAL NON-JURISDICTIONAL WETLANDS AS OF 1991

Acres:	5285 acres of non-jurisdictional wetlands
Parishes:	Jefferson (Westbank) Orleans (Westbank) Plaquemines (Belle Chase)
Parcels:	44
Tracts larger than 200 acres:	3690.1 acres, see Table Fourteen 9 parcels 71% of land
Tracts in or near Barataria Corridor:	924.64 acres (total) See Table Fifteen 17 parcels 17.4% of total 621.6 acres (residential) 13 parcels (residential) 12% of total (residential)

Source: Dr. Buddy Baehr, U.S. Army Corps of Engineers

Table Fourteen summarizes the large parcels (over 200 acres). A total of 1,407.8 acres (A&B) south of English Turn are in public ownership or the Audubon Foundation or lack sewer and water. Another 218.2 acres (C&D) are industrial property along the Intercoastal Waterway.

Within Plaquemines near Belle Chase (E) are 228.2 more acres of rural property with poor egress. Parcel HH is used for a solid waste dump site of 232 acres.

There is a 400 acre parcel (S) northeast of Lapalco and east of the Harvey Canal. The land was sold to numerous individual lot owners. It is perceived by the market to be a high crime area and assemblage by one or two owners has thus far not been feasible. In a similar condition is a 294.7 acre parcel (G) near the Donner Canal in Orleans Parish.

This leaves three parcels of over 200 acres for residential development. Parcels KK and MM are southwest of Avondale Shipyard and west of Waggaman. They are at the far edge of the market and have poor egress. Thus far, average or above average income buyers have not been attracted to this location. These parcels are not served by an interstate roadway and are in the vicinity of the WillowWood subdivision, which has had limited market acceptance. None of these parcels is suitable for a public golf course or housing oriented toward a golf course community.

Table Fourteen

**PARCELS LARGER THAN 200 ACRES
NON-JURISDICTIONAL WETLANDS
WESTBANK OF ORLEANS, JEFFERSON, AND
PART OF PLAQUEMINES PARISHES**

Map Key	Acres	Location	Development Restraints
A	280	Plaquemines Parish, south of English Turn	Occupied with Tulane University Research Lab.
B	1,127.8	Orleans Parish, Lower Coast of Algiers, south of English Turn	Lacks public sewer and water; 2 lane asphalt road egress; fragmented ownership-Coast Guard land & Audubon Wildlife Refuge
S	400.0	East of Harvey Canal, northeast of Lapalco (Jeff. Parish)	Market views it as high crime location; fragmented ownership
C D	116.8 <u>101.4</u> 218.2	Orleans Parish, Lower Coast of Algiers, south of English Turn	Industrial zoned sites located next to Intracoastal Canal
KK MM	385.0 <u>126.5</u> 511.5	West of Waggaman, SW of Avondale Shipyard (Jeff. Parish)	Far edge of market; poor egress; Residential zoning
II	397.7	South of Avondale Subdivision (Jeff. Parish)	Low income housing area; lacks sewer
G	294.7	Orleans Parish; near Donner Canal	Residential zoning; platted with streets; separate ownership
E	228.2	Plaquemines Parish, adjoins Belle Chase	Rural site; poor egress
HH	<u>232.0</u>	Churchill Farms area (Jeff. Parish)	Used as solid waste dump site
Total	3,690.1	Percent of non-404 Jurisdictional Wetland: 71%	
Source: Documents supplied by Dr. Buddy Baehr and wetlands from wetland maps supplied by U.S. Army Corps of Engineers.			

The last site is 397.7 acres south of Avondale. Much of the site lacks sewer. The parcel adjoins an area of moderate to low income housing. Again, this location has thus far been unable to attract average or above average income residents. It is a far longer commute to the jobs of the Harvey Canal or downtown New Orleans than the Estelle site.

In my opinion, none of these sites greater than 200 acres are competitive with the subject site as of May, 1996.

Table 15 describes seventeen parcels within the Barataria Corridor which are labeled as non-wetlands on the 1991 U.S. Army Corps of Engineers internal topographic map.

Portions of parcels BB, M, N, O and V have all been purchased for development or have actually been developed since 1991. The remaining parcels include industrial or commercially zoned areas (GG, W, X and U) which are not likely to be used for residential land that total 323 acres. The remaining residential parcels are far too small to support a planned golf course community with a municipal golf course in the Barataria Corridor. Even assembling a 130 acre vacant parcel able to house a golf course with no residential development does not appear feasible based on the acreage identified on the Corps map.

Jefferson Parish receives a substantial public benefit through the gift of the land for a municipal golf course by Estelle Plantation land owners. The \$2 million or more gift of land is only likely if adjacent parcels held by the land owners are available for development.

The fact that these few parcels of non-wetlands remain in West Jefferson is a tribute to the marketplace's diligence in finding land for development. Conversations with large scale development firms such as Sunrise Homes, JBL Homes and Mitchell Corporation have all reiterated their extreme difficulty in finding parcels suitable for subdivision development in West Jefferson. In East Jefferson the land shortage has caused numerous buildings to be purchased and demolished for new construction. Commercially and industrially zoned land has been purchased for apartment construction. A former sewerage plant site has been made into a subdivision. There is a growing land shortage evident in Jefferson Parish.

Table Fifteen

NON WETLAND PARCELS IN BARATARIA CORRIDOR

Map Key	Acres	Description
BB	114.7	Near Oak forest site; Highway 45 access; sewer and water available
U	166.0	Industrial parcel east of Woodmere on Destrehan Blvd.
AA	14.18	Small residential parcel at front of Bent Tree Subdivision
Z	7.72	Frontage on Lafitte-LaRose Hwy. near Bent Tree Subdivision
V	113.0	Residential parcel with sewer and water
Y	15.0	Small residential parcel
CC	21.7	Irregularly shaped residential parcel
X	28.1	Commercially zoned parcel near Lapalco Blvd.
W	37.0	Commercially zoned parcel near Lapalco Blvd.
P M N O	101.4 44.8 42.2 <u>79.1</u> 267.5	Remainder of parcels in original Lake Timberlane/Stonebridge assemblage. Remainder of 1,517 acres purchased in 1981 for Lake Timberlane Planned Community.
FF EE DD	29.14 17.9 <u>20.8</u> 67.84	Residential parcels south of Mayronne Canal. Moderate to low income housing adjoining.
GG	71.9	Commercially zoned parcel
Total	924.64	17.4% of total non-404 Jurisdictional Wetlands
Residential Total	621.6	12% of all non-404 Jurisdictional Wetlands
Source: Map of Westbank of Jefferson and Orleans prepared by U.S. Army Corps of Engineers, Aerial photographs from 1985, Exhibits provided by Dr. Buddy Baehr, U.S. Army Corps of Engineers.		

Table Sixteen is a tabulation of the acreage as supplied by Dr. Baehr in response to request for production in the Zaslow case involving eminent domain actions of the West Jefferson Levee District.

The lack of sufficiently large non-wetland parcels suitable for development as a golf course community including housing and an 18 hole municipal course in a location suitable to the marketplace indicates to this analyst that a low quality wetland parcel would be required to meet the market's needs for these facilities.

APPRAISER OPINIONS OF HIGHEST AND BEST USE AND MARKET VALUE FOR NEARBY PARCELS

For the past seventeen years a variety of competent appraisers have issued written statements on the appropriate uses and values for parcels of land near the subject site. To assist the reader I have presented these opinions of value chronologically with identifying maps for each parcel. These appraisals span thousands of pages of documents which were produced as part of litigation involving the National Park Service or the West Jefferson Levee District. All of the documents were subject to production under current public document laws.

The first group (Table 17) are appraisals commissioned by the U.S. Park Service to assist them in purchasing property for the Jean Lafitte National Park. The appraisals occur between July, 1979 and May, 1984. The parcels are generally south of the existing "V-levee" and have never been within a levee system (existing or prepared).

Each of the parcels was considered to have some or all of its use as suitable for development.

The National Park Service in two instances internally updated opinions of value without altering their highest and best use conclusions of residential development.

Opinions of Appraisers Employed by the National Park Service

Between September, 1979 and May of 1984 a total of 20 appraisals were prepared by appraisers selected by the Park Service of parcels 1.0 or more acres in size with commercial or residential highest and best use within two miles west of the subject site. All of these appraisals were done prior to the Park Service negotiating a sales price with the land owner. The appraisers were Mr. Robert Merrick, MAI., Mr. Joseph Billa, MAI and Mr. Peter J. Tulluto, MAI.

Table Seventeen describes appraisals by Mr. Merrick and Mr. Billa of large parcels of land generally outside of any levee system with no sewer, outside of any drainage district and with limited water access since they are within the "no water supply" zone of the Marrero-Lafitte Highway south of the "V-levee".

These four appraisals are for large tracts of 151 to 464 acres. At the date of the appraisal, the residential land value estimates were:

<u>Acres</u>	<u>Value per Acre</u>	<u>Date</u>
151.0 acres	\$ 7,830	5/84
44.47 acres	\$ 9,150	9/80
230.0 acres	\$10,000 to \$14,000	9/80
464.0 acres	\$ 5,600	1/82 (developable portion only)

Table Eighteen lists six smaller parcels with residential highest and best use appraised by Mr. Peter J. Tulluto from 1980 to 1985. These parcels are also about two miles west of the subject on Louisiana Highway 45. They were outside of the levee protection system, lacked sewer, lacked drainage and had limited water availability. The five appraisals in 1983 to 1985 were identified as having a highest and best use for suburban residential development with average values of \$26,486 per acre and \$22,220 per acre being typical.

Table Nineteen lists eight parcels with future commercial usage appraised by Mr. Peter Tulluto, MAI from 1979 to 1983. All of these parcels were outside of the levee system, had no drainage or sewer and had visibility on a two lane winding asphalt road (Louisiana Highway 45) rather than the four lane divided highway of Lafitte-LaRose. The ten appraisals average \$29,800 over the four years. The 1983 land value for a 20 acre tract similar to the C-2 zoned parcel fronting Lafitte-LaRose in the Dietze Tract was \$43,560.

Table Seventeen

**OPINIONS OF MARKET VALUE
PREPARED FOR NATIONAL PARK SERVICE
1979 - 1983**

A.1 June 20, 1983 by Mr. Robert Merrick MAI, SIR (Tract 101-18)

Location: 151 acres, 1.5 miles west of subject, Parcel S,
Perkins Tract
Portion Within Levee Protection: Old BDF levee; assumes inside growth
management line
Sewer Access: 2 miles north on Hwy 45
Water Service: 10" waterline in Highway 45, fronting subject
site
Elevation: 52.82 acres of +1 MSL or higher
98.18 acres below +1 MSL classified as marsh
Rate of Price Appreciation: 6%/year (p.69)

Highest & Best Use:

- a) 10.16 acres on Hwy. 45 for speculative commercial development
- b) 42.66 acres for future residential development
- c) 98.18 acres of marsh speculative future use

Opinion of Market Value:

- a) 10.16 commercial acres: \$32,277/acre
- b) 42.66 residential acres: \$7,457/acre
- c) 98.18 marsh acres: \$500/acre (See p.72 of appraiser)

A.2 Updated to 5/21/84 by National Park Service Staff (internal document)

- a) 10.16 commercial acres: \$34,100/acre
- b) 42.66 residential acres: \$ 7,830/acre
- c) 98.18 acres of marsh: \$525/acre
(p.2 of 101-18 supplemental information on appraisals)

Note: Assumed 6% price appreciation per year

COURT TESTIMONY BY MR. IRV EPPLING, MAI

In February of 1987 Mr. Irv Eppling, MAI, tendered an opinion of market value for 4.96 acres of industrial zoned land directly north of the Estelle Outflow Canal just east of the subject, Estelle Plantation parcel. The parcel had access to Bayou Barataria and was to be acquired by the West Jefferson Levee District for a levee right of way. Mr. Eppling was retained by the West Jefferson Levee District.

The two parcels are listed on the next page with a location map.

These parcels lacked sewer, water and access road at the time of the appraisal and for the foreseeable future. They were within a drainage district.

Mr. Eppling appraised these parcels for \$12,620/acre for a 3.43 acre parcel and \$13,461/acre for a 1.53 acre parcel. Clearly, Mr. Eppling estimated land values based upon a strong likelihood of developability in the near future.

In a similar manner he testified in the 24th Judicial District (WJLD vs. BDF et al) to an appraisal of 57.40 acres of residential land (Parcel S of the Perkins Tract) on Barataria Blvd. as of February, 1988 which were inside of a drainage levee, had water access but no sewer and were classified as a jurisdictional wetland on the map he supplied from the Corps of Engineers. He testified to a \$23,000 per acre land value in 1988 for this parcel one mile west of the subject at a time period when he has publicly testified land values had declined from their 1985 peak value in 1988. He did not classify these parcels as being future speculative residential land nor does he assign a land value consistent with a long term speculative use. At that same time he appraised 5.917 acres of commercially zoned land adjacent to the residential parcel on the two lane, asphalt Louisiana Highway 45. He concluded that the market value in February, 1988 was \$1.30 per square foot and says in court testimony this is 30% to 40% cheaper than their market value in 1985. This would be a market value for commercially zoned property of about \$55,000 in 1985 dollars - the peak in the market at that time. Mr. Eppling in that case had also been retained by the West Jefferson Levee District.

OTHER COURT TESTIMONY

A recent group of appraisals have all focused on land near the subject either within the hurricane protection levee or as if the site was within the levee. In each case, a complete development approach analysis and market feasibility study was conducted. All of these appraisals have been subject to deposition questioning or court cross examination.

As of June 26, 1991, a 167.1 acre parcel owned by Dr. and Mrs. Zaslow adjoining the protected side of the "V-levee" was appraised by Wade Ragas, PhD, MAI. The estimated market value was \$11,760 per acre with a highest and best use of residential development by 1995. Judge Tienmann of the 24th Judicial District accepted the arguments put forth in this opinion of value and ruled for damages based on the appraisal in favor of Dr. and Mrs. Zaslow.

As of October, 1994, both Dr. Ragas and Mr. Richard Brewster, MAI, tendered opinions of market value on four parcels within the Perkins Tract identified as parcel 1C-1 (101.26 acres), K-3 & K-4 (69.04 acres) and K-2 (92.6 acres in parcel O). The opinion of market value by Dr. Ragas was \$15,250 per acre and by Mr. Brewster was \$16,000 per acre. These appraisal opinions included lot absorption studies and development approaches to value based on engineering cost opinions. The elevation and character of these sites are similar to, although somewhat inferior when compared to the Estelle Plantation Parcel. Mr. Pat Egan, MAI, of Robert Merrick Appraisals, agreed with these opinions of value if the parcels were within a hurricane protection levee. Mr. Egan was retained as an expert by the National Park Service.

The history of appraisal opinions (including more than a dozen I have not cited) from 1979 to 1996 on parcels near the subject in the Barataria Corridor is clear. Parcels within the levee and subject to drainage were viewed as being currently developable. The highest and best use was generally found to be single-family residential for either immediate or near term future development. Parcels with sewer and water available of a size suitable for residential development were estimated to be worth between \$11,500 to \$16,000 per acre between 1990 and 1996. However, none of these opinions of value considered a golf course community, which usually commands a substantial price premium in the market place.

LOT ABSORPTION RATES NEAR ESTELLE PLANTATION

Due to a shortage of land in West Jefferson available for development without the need for a Section 404 permit, only a few subdivisions have been developed. Thus far I have tabulated lot sales activity and prices for five subdivisions on the Westbank of Jefferson and Orleans Parishes in the course of analyzing the market values of parcels C-1, K-3, K-4 and K-2 (part of O) of the former Perkins Tract now known as the Bayou Des Familles development. Mr. Richard Brewster, MAI also performed an independent absorption analysis of six other subdivisions on the Westbank, including parts of Plaquemines Parish. Subdivisions such as Barkley Estates and Grande Terre have been updated to December 1995. Ridgecrest is not actively seeking lot buyers since the developer is building houses on each lot themselves. I will update the sales of houses at Ridgecrest shortly.

The survey period, sales, sales per quarter and typical lot price from these appraisal reports by Richard Brewster MAI and Wade Ragas, Phd MAI, which have been submitted as expert reports in the U.S. National Park Service vs. Land (K-2, K-3, K-4, 1C-1 which total over 200 acres), to be heard in the Federal District Court in June of this year, all demonstrate that current development was feasible. Under oath during a deposition Mr. Patrick Eagan, MAI also agreed if the sites were within the hurricane protection levee residential development would be feasible. The appraiser's conclusion of residential subdivision usage as the highest and best use means in their opinion that there is a "market need" for the development of these parcels now.

A total of 616 lots were recorded as sold across the eleven developments as of Fall, 1995. A total of 921 lots were approved for development. Most of these lots had been built by April, 1996. I am now updating these lot sales totals to April, 1996. Probably another 20 lots per month were sold, or 120 more lots across five active subdivisions. The lot inventory as of Fall, 1996 was about 300 lots. A sales rate of 30 or so per month was typical in the recent past. I expect the lot inventory as of April to be about 180 lots. This would be a six month supply of lots. I can not find any large supply of unsold lots in new subdivisions within West Jefferson or Westbank Plaquemines. I have not yet tabulated lot sales at English Turn or available inventory. Similarly, I have not yet searched for lots held by builders awaiting sale or house construction in Lake Timberlane/Stonebridge.

Map Code	Subdivision	Total Lots	Number Sold	Survey Period	Months	Sales per Month	Avg. Sale Price	
							Lot	Sq. Ft.
1.	Lake Timberlane 4	157	157	6/91 - 12/94	42	3.7	\$19,200	\$2.81
2.	Magnolia Trace	29	18	1/95 - 7/95	6	3.0	\$55,600	n.a.
3.	Ridgecrest	60	35	11/94 - 7/95	8	4.4	\$26,400	\$3.33
4.	Shadowlake Ext. 3	44	43	6/93 - 3/94	9	4.8	\$24,700	\$3.74
	Shadowlake Ext. 4	36	36	6/94 - 3/95	9	4.0	\$22,100	\$4.09
5.	Grand Terre	95	23	5/95 - 12/95	6	3.8	\$43,700	\$3.65
6.	Windsor Place	36	26	6/94 - 7/95	12	2.2	\$41,100	\$3.79
7.	Woodlands	85	85	9/93 - 5/95	21	4.0	\$36,900	\$3.62
8.	Barkley Est.	264	78	3/94 - 12/95	22	3.5	\$40,500	\$3.80
9.	Bent Tree Est.	37	37	11/92 - 12/94	24	1.6	\$21,433	\$3.76
10.	Debattista Pl.	36	36	5/93 - 11/94	18	2.0	\$35,944	\$6.25
11.	Woodlands	42	42	11/93 - 11/94	12	3.5	\$36,972	\$3.83
Source: Appraisal reports of Richard Brewster, MAI (Parcels K-3, K-4, Perkins Tract dated April 12, 1996 and Wade Ragas PhD, MAI, (Parcels K-2, K-3, K-4, Perkins Tract) dated April 15, 1996.								
Note: Barkley Est., Lake Timberlane, Grande Terre and Windsor have all experienced substantial lot sales not reported here between Aug., 1995 and April, 1996.								

These counts of recorded lot sales reveal a very small inventory of finished lots still unsold as of mid 1995. The typical subdivision sold three to four lots per month for lots priced between \$33,000 and \$60,000. Among these average income and above average income subdivisions the only existing lot inventory is in Barkley Estates and Grand Terre.

The only significant lot inventory is in Barkley Estates which had 186 lots under development or unsold as of December, 1995. At the historic lot sales rate of 3.5 per month, this development would have a four year supply. However, the lack of competitors - only Magnolia Trace and Ridgecrest in West Jefferson - means a more rapid rate of sales this summer is likely. The history of golf course development presented herein shows it is not unusual for large developments like a golf course community to have a development period of 10 to 13 years. A 264 lot subdivision like Barkley Estates would be one of several large residential subdivisions serving the markets for 5 or 6 years during its sales period. The fact the developer has gone forward with lender approval to construct more lots than immediately needed means they are anticipating a further increase in demand in the near future. Current employment gains in the oil service industry on the Westbank and their lack of competition in the future by other subdivisions would be consistent with these judgments by the land owners.

Barkley Estates is equivalent in lot quality to the proposed Estelle development but has no golf course. Grand Terre is in Plaquemines near Jesuit Bend, as is Windsor Place and Woodlands. They are far removed from most job centers and access to the rest of the market is poor. Nonetheless this area is experiencing rapid growth.

The Lake Timberlane extensions are not part of the golf course community. Sales in the golf course community have not yet been researched.

CONCLUSION

Thus far in this research, the actual rates of market sales would support lot prices not on a golf course of \$40,000 to \$55,600 with a price per square foot of \$3.50 to \$3.80. An expectation of 3.5 to 4 lots sold per month for locations without a golf course is reasonable. An off the course lot price of \$42,000 would be reasonable. A golf course lot price of \$55,000 would be a 19% premium for golf views, which is not unusual. Historically, golf course lot premiums in the New Orleans area have been 15% to 25% above lots without course views.

Actual recent court testimony on market conditions by Mr. Irv Eppling, MAI, and Rudy Aquila, PhD, MAI, indicated an expected 50 lot per year minimum rate of sales for an average income subdivision near the subject. They were retained as experts by the West Jefferson Levee District. Similarly, depositions by Richard Brewster, MAI and Wade Ragas, PhD, MAI, have also documented that average income as well as above average income lot absorption rates of 3.5 to 4 lots per month for sites near the subject as of 1996 produced financially feasible residential subdivisions without the cost of a golf course. In fact, rates of sale below three lots per month produced financially feasible subdivisions. A discounted cash flow analysis of the Estelle Plantation golf oriented community is being prepared by this analyst and should be available shortly.

Addendum A

English Turn and Eastover

FOR SALE - SEALED BID

79.87 Acres on Eastover's Golf Course

LOCATION: Along Bullard Road and the eleventh, twelfth and thirteenth holes of Eastover's Golf Course off of Lake Forest Blvd.

ZONING: RO-1 Residential/General Office District 67.85 Acres
B-2 Neighborhood Business District 12.02 Acres

LOCATION OF SEALED BID: LL&E Building, 909 Poydras St., Suite 1700, New Orleans, LA 70112

TIME OF SEALED BID: Anytime before 10:00 A.M. on March 22, 1996

MINIMUM BID AMOUNT OF ACREAGE SOLD: At least 20 acres of RO zoning, or the 12.02 acres of B-2 zoning

AVAILABLE ACREAGE WITH MINIMUM BID PRICE: 39.85 acres @ \$0.75 a square foot (RO zoning)
28 acres @ \$1.50 a square foot (RO zoning)
12.02 acres @ \$5.00 a square foot (B-2 zoning)
(See plot plan on reverse side)

COMMENTS: The property is located along Eastover's Country Club, one of the finest golf courses in the Southeast and in an area of vigorous retail development, including Wal-Mart, Toys R Us, Pep-Boys, Shoney's, Leader Buick and Best Western.

NOTICE: Owner reserves the right to refuse all bids.

**Great News
May 5th, 1995**

English Turn is now offering true lake lots in the Lakes Community. These sites are expected to be developed and ready for home construction by December 1995. Sites will range from .42 acres to .60 acres and are priced from \$118,300 - \$165,000. The Lake encompasses 7-1/2 acres of waterways which offers you on most of these sites a expansive (250' - 600') water view.

Keep in mind, the developer continues to offer you special incentives such as 0% financing, construction rebates, and pre-completion prices. In addition, the developer has agreed to build an entry gate allowing property owners on the south side of the golf course a more convenient access to this area.

Please call me at (504) 392-9100 for more information or a personal site tour. Hope to see you soon.

Sincerely,

Glenn Mediamolle
